5262. Re: four player adapter & Link cable

Newsgroup: comp.sys.atari.st
Date: 2000-11-05 23:11:18 UTC
From: Mark Bedingfield <mark@baypc.com.au>
Message-ID: <8u4p2s$rb8$1@perki.connect.com.au>
Source record: 55045

No Iggy the ports are Analogue while the 9pin ports are Digital. They have about as much in common as Hard drives and floppy drives:-)

Here is the correct wiring for the 4 player adaptor- made 1 yesterday:

Printer port Joy3 Joy4
1 6
2 1
3 2
4 3
5 4
6 1
7 2
8 3
9 4
11 6
24 8
25 8

and that is all there is to it:-)

Mark

You still cant beat the Atari for games, what I meant was NEW games. And as
far as hardware goes, I only invest in good technology. Playstation is a
joke, Nintendo kick them in the can every time in hardware performance. That
is what dictates what console I will buy. Not flashy Add's, thats why I
bought an Atari to start of with.

DOS
> shit around.
>

Imagine how much better Win9x would be with NO DOS support at all. Atari
ditched it when things went 16bit as did Apple and Commodore. Who wants to
run Alley cat on a Thunderbird 1100. Even if you dont use DOS app's the

system may still do it. Did you ever wonder what a Legacy device was, and why you cant use IRQ 3 & 4, or why 3BC shouldnt be used for the LPT port. Windows is a 32 Bit bolt on, no more no less....

> What Atari needs is to more forward with faster system, so that the software
> can do more.... don't that sound like micocrap shouting at intel eons ago?

The best thing you can do with ANY computer is use it and not Bitch and whine that it isn't fast enough or that you cant do this or that. I can do most thing's on My Falcon so I dont care how fast another person's machine can render a POV file. All I care about is that I can overcome obsticals as they arise. If I didnt I would have a Cray or a Silicon Graphics Workstation:-)

Any decent software will provide the SCSI error message sent by the
drive on the attempt to format it. With this error message you can
usually see what's wrong.

Maybe so, but I looked at the message in both in Newsie and Free Agent
(on the PC) and it appeared the same in both. I know that some
newsreaders are able to re-format long lines automatically, but is it the
responsibility of the reader or the sender to ensure the message is
universally readable ?

(I suppose it is a bit like the HTML argument.)

I know Steve is a regular contributor to this group and this is the first
time I have noticed a problem with his postings which is strange.

Apologies if I'm wrong, Steve, but your lines did come out a lot longer
than Ulli's dialogue boxes :-))

Cheers

Paul

Oh really? I never owned a PS, PS2 or N64. Didn't really play many arcade games, more of strategic games for me. I'm sure that those console will also have strategic games.

>
>Imagine how much better Win9x would be with NO DOS support at all. Atari

It's funny that DOS is so lame that on Microshit now have a WSH, which runs batch jobs.

>system may still do it. Did you ever wonder what a Legacy device was, and

Don't know them, nowadays there's IRQ steering and other fancy stuff like plug & pray, which takes care of all these. They don't work most of the time, but after enough hammering at it, it will tend to obey what you want it to do.

>
>they arise. If I didnt I would have a Cray or a Silicon Graphics
>Workstation:-)

Windows Scripting Host doesn't run DOS batch files, though. It's a
hybrid batch language that's a good deal more powerful.

>Don't know them, nowadays there's IRQ steering and other fancy stuff like
>plug & pray, which takes care of all these. They don't work most of the time,
>but after enough hammering at it, it will tend to obey what you want it to do.

And if they don't you can force your will upon them by hardwiring your
IRQs. I've had to do that on occasion...

5270. Mixed text and HTML, was 'Windows 98 source code cracked'

Newsgroup: comp.sys.atari.st
Date: 2000-11-06 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <3A06B8A7.49B85366@patent.gov.uk>
Source record: 54955

Hi all,

I have been flamed in this news group by Dave Parsons, Derrick Cracker
and
'xlator@cix.compulink.co.uk and supported, either directly, or
indirectly,
by way of noncommittal, by Steve Stupple, Steve Sweet and Marc Wilson
for
including a section of HTML coding in a message sent to this news group.
I would like to set the record straight:

a. The original spoof (surely you did realize it was spoof?), was in the
form
of a Web page. I thought at the time that the readers of this NG would
appreciate
the joke at MS's expense, but how to communicate the joke? I have in the
past, merely
communicated the URL's of interesting Web pages, but in this case there
was no URL,
I received the HTML as a windows attachment. I could have used
HTML2TXT.TTP but chose
instead to send the source code, with a clear warning in the text.

b. I chose to embed the code in the text, using cut and paste, rather
than send as an
attachment. This latter would have been OK for Netscape/PC users, but
ignores the
fact that most of the NG readers use Atari systems, with readers not
capable of
automatically recognizing and decoding HTML. I reasoned that either a
reader of the
message would not be interested, in which case they would pass it by, or
if they were,
they would have the elementary knowledge to cut and paste the HTML,
rename the saved
file with an HTM extension and view in CAB. Apparently this course of
action, was too
much trouble.

c. Since my assumptions of the degrees of sense of humour and lateral
thinking of readers
of this NG, were severely at fault, I shall refrain from any further
attempts to lighten the
mood of this NG, or indeed supply it with translations of German news
mailings, or send out

requested software, and let it be filled with tales of software houses abandoning the Atari
market, questions from tyros who cannot be bothered to read past messages, and wild
speculations of NEW REBORN ATARIs.

After all one does not want to offend the arbiters of Netiquette, does one?

Bob King.

Hello All,

You are probably wondering what has to do with Atari. Well I bought one of these to pick up the leaves in yard. The thing is that the symbol used by Yard-Man is 3 blades of grass. When this symbol is upside down it looks exactly like the Atari fuji symbol. Kind of a bonus for me.

I used to have a 5.25 inch drive in my ST setup, but took it out and put in
a CD drive. The drive worked fine, but it would not read 8-bit disks. I
could read PC disks though and format it in the Atari mode and use it that
way.

You are correct there Lonny. I found the website where Photoline comes
from. I hear sometime ago that the Atari version was getting an upgraded,
but have not heard anything. I would love to use it under Magic as right
now it does not work, but works fine under Geneva.

Nima comes and goes. If he is not answering his email, he will soon. He is
a good guy. He helped me alot with the Atari CD Master programs.

Hi Edward,

Having used an HP 510 for many years with DA's Layout TC, I bought an HP
960C
for colour work. Unfortunately, as well as needing a great deal of RAM
to print
in colour, strangely some programs work with my Falcon with only 14Meg
but not with
my Milan with 24Meg, DA seems to insist on grabbing all available memory
and just
refuses to print in colour with the Milan. I have tried limiting memory
in the mint/neas
cfg files, but although this limits DA's memory grab, it still wont let

it print.
Of course, as you say there is a very poor selection of drivers
available, and I have
had to use the 550C. As DA's my choice of DTP, I may have to get
Calamus. Any advice
on its colour printing requirements would be much appreciated. I see you
have 140Meg, I am
looking to getting that amount?

Hi Edward,

There was talk of the Milan 2 being bundled with an upgraded version of
Photoline, but what credence can we put in that? Re earlier replies to
my
above posting, I was aware of course that Homa was only the supplier,
not the
writer of Photoline!!!

Hi Edward,

Yes it is, but very difficult to find. I have a partly translated late
version. There
is an earlier version with a program that translates it (to english),
but the later version
shows a larger range of different formats. It is a superb program, the
auto scroll and the
filters are the best out, the ones to increase focus and sharpness, the
best. If you want
it just yell at home.

Yep, it's on the Belgian ftp-server

ftp://chapelie.rma.ac.be/atari/graph-tools/gt970907.lzh

The homepage of Graftool can be found on the UTSI (see my signature).
Follow the graphic link. NOt sure if the link is still working. It's a
long time since I've cheched it.

AFAIK Photoline works under Magic but it needs a patch. Anyway it works
under freeMiNT/N_AES.

It surely is much better then the 99 version. Above all Invers do their
best to get it good wroking under N_AES too. So far SL2000 is the most
stable version. I surely casn recommend SL2000. You won't regret.

No Paul surely doesn't owe an apology. As one post to a Atari newsgroup
one must take in account that not everyone use Nescape or Outlook express.
Okami can handle this kind of long lines but I refuse to do that.
The Netiquette recommend to use line of max. 75 chars. So why don't he use
this? I know that Outlook Express and Netscape or whatever pc/Mac mailer
on use can be configurated this way.
And before you begin to shout that I don't follow the Netiquette myself.
Yes I know my signature is too long.

Hi Martin,

There are two versions as you know, one for the ST (and the Milan) and
another for the TT and Falcon
with FPU. The scanner import doesn't work with GTLook2, but you can't
have everything. Manual leaves
a lot out. It is much more powerful than seems at first.

Hello world,

Since some time I notice over and over again that messages posted with
Modzilla and the famous Outlook express looks rather strange when viewed
with an Atari mailer, be it Okami, ASH mailer or Newsie.

It probably has something to do with the auto adaption of the text to the
window width.

e.g. taken from an earlier posting to c.s.a.st

**********START FILE**********
There was talk of the Milan 2 being bundled with an upgraded version of

I'm pretty sure that one can change this behaviour. So please guys can you
make a little effort and adapt your mailer? Afterall this is an Atari
newsgroup where still lots of people uses Atari soft. I think quite a few
Atarians will be greatful if you do so.

TIA,
Martin

Hi!

I have a question concerning a GoldenImage hand scanner. It works
great with the Touch-Up graphic program supplied with the scanner.
However, when I try to use "Scan" option in any other application,
(eg. OCR or Chagall) I get "No GDPS Scanner driver installed"
message. Why? Where can I find that GDPS driver and how to install it?

Hi Martin,

As you know I am the author of the above, the posting was done as you surmise
on a PC, probably Modzilla and Outlook. Truncated lines are merely because I
```

give them hard returns at the end of each line, when it seems a reasonable length.
I am doing the same here with QED. How does this turn out?

Bob King.

Is this running on an Atari? I do have some PC BBS door software
somewhere, including LORD (Legend Of the Red Dragon) by Seth Able.

Interested?

Cheers!

I could sell you mine. I believe it works completely (the floppy drive seems to load data disks), but haven't a monitor/mouse to fully test. I'm selling it for $5.50 US$ (figure out what that comes out to in UK pounds or whatever) and I can figure out shipping once I get your full address, if you decide you want it.

This discussion seems to point out the problems that exist in using the web in general.

Let's take Netiquette, for example. Say I'm new to the net. How am I supposed to find out what the Netiquette is? No books come with computers anymore. Online (program online, not online here) help stinks at best. Netscape's is one of the worst examples IMO. The only way a new user learns is by doing, and when they screw up often they get yelled at.

Even in this newsgroup, I've seen replies that, if I were a new user, I would never ask another question again here based on the tone of the answers. I took a couple of people to task about that some time back, and in turn was treated rather unmannerly. New people are always going to be asking the same questions over and over again, so if an experienced user needs to reply in a manner that the new user can understand, not the experienced user.

IMO, things on the web have advanced to the point where we shouldn't have to worry about line length, either because the software can handle it, or somehow mandatory rules are put into place to prevent the problem. But, keeping standards to a minimum was part of the goal of HTML, wasn't it? If so, that in itself leads to problems you will just have learn to deal with. Even Netscape and Internet Explorer treat a few tags differently, each supports it's own subset of tags, all causing problems for someone somewhere. If people wish to keep the web as free form as possible, then learn to live with these differences and stop complaining, or else agree to mandated standards where much of the free form abilities will be lost. I ought to be able to use HTML for posting, but too many people can't deal with it in this newsgroup, so I use the plain text editor. But there have been times when an answer could much more easily have been explained with a picture rather than text only.

This also somewhat illustrates the problems with using an Atari on the net. The software and hardware just isn't keeping up. It's like trying to compete with a fleet of trucks made in 2000 with a fleet of trucks made in 1985. You can't.

I used to really support this platform to everyone I know, now I rarely do. About the only place this platform is now useful is as a simple

learning tool for stepping up to modern computers. Once new users find
out what can be done with modern computers, almost none of them would be
happy with an Atari computer. It's one of the reasons I don't have any
of my Atari's on the net anymore, and also indicative why they rarely
get turned on anymore. They aren't worn out, nor broken. They just
can't do what I want a computer to do anymore. And without hardware and
OS advances, and a lot of money and successful marketing, they never
will.

> Okami can handle this kind of long lines but I refuse to do that.

Strictly out of curiosity, why not?

> The Netiquette recommend to use line of max. 75 chars. So why don't he use
> this? I know that Outlook Express and Netscape or whatever pc/Mac mailer
> on use can be configurated this way.

True, but how many users ever learn how to do that? Not enough of them,
that's for sure. <G> A lot of the users I know are just happy they can
get their email to work.

> And before you begin to shout that I don't follow the Netiquette myself.

I wasn't going to say a thing, because I didn't know it was! <VBG>

I have no control over my line length.

As mentioned elswhere, its the resposibility of the receiving software to format according to local requirments. That is the law according to RFC, so i'm compliant with that, whereas a minority are not, so technically i'm within the groups regs as i post with the RFC rooles.

Hi Grzegorz,

GP>Why?
I suppose because you did not install a GDPS driver.

GP>I have a question concerning a GoldenImage hand scanner.
I'm afraid there will be no GDPS driver for that scanner.

Maybe there are two 'solutions' (two further possibilities for you): If the supplied program is able to run as an accessory (try it by renaming and rebooting), you might access it whilst running OCR or Chagall.

Or, you might try to run STAD (ST Aided Design). Very old, b/w only. But maybe it understands your hand scanner. I admit that's a lot of 'maybe's, but the only alternative I see is buying a SCSI scanner with GDPS driver...

Sorry

Yes.. point taken. I too have learnt my lesson and now do not do anything
by myself... as I had done with the sharware scheme. The Limited company
although owned by me is not run by me alone... I have nothing to do with
it's operations, which leaves me enough time to run the company.

Well, I don't know for sure about the "big 8" (or is it 9, Bruno ?) but
on the fr hierarchy there are a few newsgroups where one can find the
basic rules and advices about what should be done and what shouldn't.
These are fr.usenet.* newsgroups. Opening the NG file here, I can see
newsgroups that may be of the same use, for example:

gov.usenet.questions
gov.usenet.answers
gov.usenet.test
gov.usenet.software

.../...

It's not a matter of using an Atari or not. It's just a matter of
(config) softwares. It's well known that MicroSoft reinvent tu rules
ever and ever again on the usenet topic and that they (often) want to
impose them to the whole world. Why should they bother with RFCs ?

Do not misunderstand me, I'm not specialy against MicroSoft. But I often
read complaints from people using other agents on PCs.

Bye,
/Pascal/

Its quite obvious what a new Atari would have to be - it would have
to be a faster, bigger compatible version of the old. How that is
done is irrelevant. If it is not compatible with the old then it is
not an Atari.

If you don't know how to do such a job you
probably couldn't do it even with the right
information (note: this is nothing personal).
False economy. How much is an upgrade
board these days? Not very much at all
for something that is properly designed to
do the job instead of hacking around.

>Let's take Netiquette, for example. Say I'm new to the net. How am I
>supposed to find out what the Netiquette is? No books come with

The best thing for a newbie would be to hang around for a little while in the newsgroup before making a posting and see what the others are doing. That, in part, is why I've those hobby-horses about over-quoting and other suchlike stuff. I simply don't want or have the time to scroll through the previous ten messages that someone's quoted, to see that they've stuck a "me too" on the end.

>Even in this newsgroup, I've seen replies that, if I were a new user, I
>would never ask another question again here based on the tone of the
>answers. I took a couple of people to task about that some time back,

I'm actually very concious of this too.

>message. Why? Where can I find that GDPS driver and how to install it?

Check out Homa Systems House at http://www.magma.ca/~nima/

Nima's ScanX scanner driver is GDPS-compatible, and works very well
indeed - all I do is run it and close its window - it sits in the
background and is automatically called from the "Scan" menu item in
supporting applications. It works very well indeed from within such
programs as Alexander Clauss' OCR. Not sure how this works with non-MagiC
systems, I'd expect it to be similar.

The downside is that there isn't such a driver AFAIK for your scanner,
Nima's is for flatbed scanners which connect via the SCSI system.

Calamus (and the other programs that Grzegorz mentioned) use the GDPS
system for accessing scanners. It's similar to the Twain system on PCs -
a protocol rather than a specific driver or scanner.

Date: 02 Nov 00 02:09:20 +0100

Hi Iggy,

>>Note that the above mentioned stacks are placed in order of being
>>released.
>
>Is that so? I thought Wensuite predated iConnect, and STiNG as well.
Yes it is.
The very first version of IConnect saw the light early 1996, STiNG arrived
six months later. Wensuite first measly attempts were a year later...
A couple of years ago Peter Rottengatter explained here why he developed
STiNG, one of the main reasons was to have PPP access under TOS, since
IConnect and MinTNet are both OS dependant. Another reason was that he
wanted to link his computers in a network, which wasn't possible before
under TOS.

>>STIK couldn't handle PAP, and was limited to the SLIP protocol which at
>>that time was being replaced by a lot of ISP for PAP.
>
>So why not implement PAP but keep the API common?
I've no idea, but I can think of a couple of reasons: in 1995 MiNT wasn't
very well known let alone popular in Germany. The programmer probably
wasn't even aware that MinTNet existed (language barrier) and decided to
write a custom API, the one used for IConnect is 99% derivated from Unix, I
wouldn't call that something coming out of the blue...

>IConnect is just like the original STiK, a stack dedicated to one
>particular hardware layer and protocol.
IConnect can handle SLIP and PAP (PPP). As being dedicated to one hardware
layer... what in heavens name is wrong with that? not everyone needs/wants
his computer to be part of a network. Since MagiC can't handle networks
ATM it's perfectly logical that IConnect doesn't address these either.
According to the author it's not that difficult to implement support for
other layers so who knows...

>>You'll probably isagree but there's not a lot out there that can standup
>>to ASH Emailer,Teli, Chatter and Fiffi.
>
>Never mind that. You've just mentioned all the clients available for
>IConnect.
But I do mind, since the lack of clients *always* is the big argument
against using IConnect. IMO it's not the quantity which is important but
the quality of the clients.

>Your perspective is rather limited. Certainly there are slick clients,
>but a limited choice, and lacking compatibility.
Compatibility with what?
As for the limited choice... how many mailers, newsreaders, ftp apps..etc
do you use? If a mailer does all one wants, why would he need to use ten
others as well? as for looking slick... that's pure personal taste and not
really relevant. The ASH clients take advantage of nearly all the modern
GUI protocols developed over the years, if you call that slick....

>So why don't the superb ASH programs run with STiK, STiNG or MiNTnet?
Because they are designed to take full advantage if IConnect, you'll probably
argue that this is a lame excuse...
Let me return the question... how many MiNTNet clients run with STIK, STiNG
or even IConnect... and why?
Compatibility is not really an item when you're talking stacks, nearly all
clients run only on the stack they were written for. You'll probably argue
that the IConect API isn't open source... MiNTNet API is open, so why are so
few STiNG clients running on it?

>That argument is rather thin on the ground. ASH software is very slick,
>granted, but also forms a system entirely of its own. You don't have much
>of a choice. Id you want to run the emailer, you'll have to buy their
>stack, their OS and the rest of the TCP/IP software as well.
AFAIK IConnect up to version 1.7 works with N.AES also. The latest version
of Emailer runs happily under MinT/N.AES 2.0.
IConnect is not for sale, it's free, you can download it from the ASH
website...
Most of the ASH applications run happily with TOS and MiNT, granted.. they
may perform or look a little better with MagiC, but over all MagiC is not
really required i.e CAB, Jinnee, Texel, Phenix, Emailer, Artworx, Papillon,
Signum...etc

Cheers from Belgium
Dennis

Hi Simon,

>there WILL be a new Amiga machine, Eyetech are developing it and, unlike
>Centek or Milan, actually finish things.
Unlike all the vapourware announced for the Amiga platform, there are actually two Atari clones developed, produced and still for sale. The Hades060 and Milan 040, order one of these today and next week UPS will deliver the box... And I wouldn't dream of feeding all the people that are happily using a Centek expansion card either...

>Thats lame coming from an Atarian. Just think about Milan, Centek, Roldolf
>Czuba. Vapourware at it's best.
Strange isn't it that a great deal of the people here are actually *using* that vapourware, if you want to talk vapourware, talk Eyetech. And please do it in the advocacy group.

Cheers from Belgium

Strange reasoning.... especially considering your posting(s) have nothing
to do with the thread... If you have a financial matter to settle with
Titan then this is certainly *not* the place.
The reason why Titan now has a new URL is not really our concern, for all I
know they could have switched because they weren't pleased with the service
and support of Cyberstrider limited....

>>with the Janus... and that ment the end of the Janus card.
>
>It looks likes they're still available..
>http://www.vhf.de/hardware/janus/janus.html

Yes, a number of dealers in Germany still have some in stock, with the
"end" I ment that development of the card was stopped. I remember seeing
a prototype with a 68030/25 processor at the october 1985 messe, but
that never made it...
The Janus with 68020/40 can be bought for 898DM (400$) from various
German dealers, second hand Janus cards can be found starting from 100$

Hi Dennis,

yes I know that, but as Milan promised in golden days past to include an updated version of Photoline in their MilanII package, I assumed there was ongoing development. I read somewhere that PhotoLine was programmed by the team that gave us Studio and incorporated large chunks of the same code. I could never see the resemblence.

How are the camels?

Bob King

I would say that Germany was MiNT biggest "market" even back in 1995. But
MiNT was pretty small back then everywhere, the lack of a decent AES
effectively stopped it from being spread among "normal" users.

> wasn't even aware that MinTNet existed (language barrier) and decided to

MiNTnet was written by a German...

> write a custom API, the one used for IConnect is 99% derivated from Unix, I

The *socket library* that's released (and which most programmers naturally
use) is very close to standard sockets, that's true, but the actual
interface between the application (i.e. socket lib) is unknown to most
people except the author of IConnect.

> IConnect can handle SLIP and PAP (PPP). As being dedicated to one hardware

PPP is the actual point-to-point protocol, PAP is one of two
authentication methods used by PPP (CHAP being the other).

> layer... what in heavens name is wrong with that? not everyone needs/wants
> his computer to be part of a network. Since MagiC can't handle networks
> ATM it's perfectly logical that IConnect doesn't address these either.

MagiC can't handle networks?? Hmm, my TT with MagiC 6.01 is very happy in
my little LAN. Using STiNG ofcourse.

There's nothing in MagiC that prevented IConnect from being a
"real" stack, it was just a design decision.

>>So why don't the superb ASH programs run with STiK, STiNG or MiNTnet?
> Because they are designed to take full advantage if IConnect, you'll probably
> argue that this is a lame excuse...

It really is. If the programmers use the released socket-lib it's simply a
matter of recompiling to support MiNT-net. Unless they use other
MagiC-specific functionality ofcourse, which is a very valid reason
indeed. But there's nothing in IConnect itself which makes it's clients
superior in any way.

> Let me return the question... how many MiNTNet clients run with STIK, STiNG
> or even IConnect... and why?

CAB, aMail, aFTP and aICQ are the only ones I can remember right now (only STiK/STiNG though). There are probably a few more I haven't heard of too.

The problem with supporting IConnect (actually I believe aMail and aFTP does, sort of) is that the socket lib is only released as a PureC binary, and most people that write for MiNT/MiNTnet specifically tends to use Gcc.

> clients run only on the stack they were written for. You'll probably argue
> that the IConect API isn't open source... MiNTNet API is open, so why are so
> few STiNG clients running on it?

Because the authors wants their programs to be able to run on as many platforms as possible. Hardly an argument you can use about IConnect-clients ;-)

> AFAIK IConnect up to version 1.7 works with N.AES also. The latest version
> of Emailer runs happily under MinT/N.AES 2.0.

Really? Cool, another thing I have to check out. Except that I won't be able to get my PC, TT or Stacy on the net then. So it's not really an alternative even if I wanted to use it. Now if it worked with STiK or MiNTnet OTOH, and it turned out to be a lot better than the last time I tried it (which must be atleast two years ago) I might even buy it.

I agree. Isn't there some "official" recommendation (as much as anything is
official on the 'net) that newsgroups posts should be pure text messages,
except in groups specially designated for binaries, etc.

Besides, formatting a message as HTML usually does not increase its
information content at all. And sending the same text TWICE in the
same message (ASCII+HTML) is verging on absurdity.

Be careful - unlike some of the later machines (MSTe, TT for example)
the ST comes with a fixed voltage power supply. A North American model
would not take kindly to 240 volts.

Also it would be missing a key from the key-board - no £-sign, not to
mention having funny ideas about the way dates should be displayed.

> know they could have switched because they weren't pleased with the
service
> and support of Cyberstrider limited....

Judging from the statement above, you don't seem to have read the whole thread - so I'd like to point out that the origin of this thread was a question about why Titan's website didn't exist - and Denesh replied that it was due to the fact that they hadn't paid for their site Hosting for over a year (which was somewhat overlooked because Denesh felt an obligation to the Atari market - any other company wouldn't have been that nicely treated...) - and that Titan told him that it was uncertain if he would ever get paid, but they still wanted to use his company as their Host. Apparently they weren't unpleased at all - only with the fact that they suddenly had to pay... Who has the strangest reasoning...? Would you go to work when you knew you wouldn't get paid for it - or would you search for a new job?
A company that doesn't pay it's bills - especially such small bills - wouldn't get any trust at all from me, since if they can't pay for things they need for their existense - how in heaven's name will they be able to keep promises about warranty and delivery to their customers - and how would they be able to develop and manufacture new hardware when they lack the small amount of money they owe to Denesh?
I wonder if they'll be trying to rip off their new Host too - or if the whole problem was that they took advantage of Denesh because they knew how he felt about Atari, and thought they could get away with it forever...?
Besides - if Denesh's sig is considered spam - then so is mine (and just about everyone else's), but noone has complained about it yet even though I've had it for a couple of years...

Very Good Advice.

The 1 mb board usually has nowhere to place the extra chips whereas the 2 mb
sometimes has holes where you can fit the extra 16 dips to give 4mb. I have
two in stock and some upgrade kits.

Might trade you the board.

Barrie at Keychange.

I should mention here that Line Audio also sells a little modification board you can put inside of an FDI (if you have one of those) that will accomplish the same thing. It "allows" your Falcon to run audio at 44.1 without needing to hook up an external clock or a DAT machine, etc. It's very inexpensive, and easy to install. When I had a few questions regarding installation, Roger (at Line Audio) was very prompt at returning helpful answers. I also have the FAD 2/8 by the same company. Did I mention that I think Roger at LINE AUDIO is doing a great job?? ;-)

This to be honest is not the reasson for me pointing out this. The main reason was - and I accept that Denesh doesn't seem to be in the same league as TD's here - that companies/people should be mindful that critisizing one company's output is fine as long as they have no track record in that department themselves! That doesn't mean late orders or things like that but when promising after personal email contact that the items/keys would be processed just to leave everything and forget it is not acceptable I'm afraid. This now means that most of the stuff I wanted to get registered cannot be done as the Authors have left the ST scene altogether.

I do not distrust Denesh and I can understand that he did the shareware thing in good faith but it is not a good advertisement for him personally - which is a shame as all correspondance with him has proved otherwise.

There are other Atari dealers who I could name, who have been far far worse - and promote themselves in here - in my experience so I tend to stick to the one's I know now - Lesson learn't I'm afraid.

Nuff said..

Regards
Sean

>message. Why? Where can I find that GDPS driver and how to install it?

Hi

Some software was designed to work with specific scanners. Calamus, for example, has scanner input for a couple of scanners but not Golden Image's!

There are generic OCR software titles around that work FROM the image file scanned. Golden Image's OCR software is pretty good and they do a VERY LARGE collection of software for scanners.

The software you may be using, may only be designed for that specific scanner.

Funny that on NT there is the ntvdm = NT virtual dos machine and Win9x there
is the 16-bit & 32-bit subsystem. A 16bit program (DOS or say a old Windows
3.1 program) can crash and still the rest of the OS are OK because the memory
space are partitioned. Each of them have separate of what you descripted
below: conventional & expanded/extended memory.

>
>There are three types of memory on the PC, as far as any DOS-based
>apps are concerned:
>

Only when programming in 16bit or old version of VC++ we need to keep these in
mind. The latest development software treat memory as single continuous space
much like the Motorola 68000 does. It could be the Windows MM is working like
hell making it easy for developer but who cares, I can malloc 1GB of space if
I want and have no problem now.

>Xenix sucked, and came out long after the first version of Windows,

Novell was a NOS.

>Which brings us right back to the issue of support. Besides, by the
>time OS/2 Warp came out, Windows 95 was released, and people, already
>familiar with earlier versions of Windows, opted to go with the new
>Windows 95 for compatibility reasons.

What matters most is the data for application. The application just need to be
data compatible. So the application can always be upgraded along with more
powerful system/hardware. Unfortunately, in the Atari world, people still want
to play for example Dungeon Master or GODS or populous. Games are the hardest
software to be backward compatible because of non-well behave codes.

>release a new system, and at the time of the Falcon's release, it was
>quite a powerful machine.
>

There should have leap to 040 and then PowerPC, like what Apple did.

>with the exception of a fast processor. However, with the likes of
>Hades, Milan, et al., there ARE more powerful Falcon-compatibles out
>there.

I think the Atari flag have already abandon by Atari Corp. This makes ppl
loose faith in it. So compatibles will be fighting an uphill battle...

>
>Yes, but who's going to do the porting? Where will they get the
>licenses from? Or will everyone stick with basic GPL'ed apps?

If there's money to be made, I think people will port them. But then again
home users don't really need big database, ERP or CRM etc which is the revenue
generator of most software companies. OTOH, if the hardware was as capable to
say the PIII systems nowadays, I guess games company will be porting their
games because there is a market segment, but unfortunately, the economics
today makes it not as profitable as say for the Mac or Wintel.

ciao

sorry I wasn't thinking so long since I have used the Atari's for sound,
like someone else says 5to5 claims to convert several formats
they appear to be a mono 8bit pcm file signed or not I'm not sure, The Suzy
B cd collection has a lot on and somewhere in the back of my mind one of the
boot up programs superboot I think did conversions maybe someone can shed
more light.

Hi Shiuming,

Yes I can divide :)) Problem was, my german is non existant and there was I thought a hint in the manual that one slot had to have a special amount of RAM in it. I wondered if the loading was asymetrical. Turns out of course that it is 128 per slot. Thanks for your interest.

Approx $1180 for the mb+060 with no ram, give or take a little
for exchange rate as I arrived at that value based on the CHF
amount I was given.

As far as ram goes you can judge that by the prices in your
own area I guess. I had it shipped to me with 128meg of EDO
ram pre-installed and more than likely paided a bit more than if I had
gotten the simms locally.

>requested software, and let it be filled with tales of software houses
>abandoning the Atari

>market, questions from tyros who cannot be bothered to read past
>messages, and wild
>speculations of NEW REBORN ATARIs.

Don't do that - we merely suggested a way of improving your posted joke in a usenet group.

BTW, as you'll see from your quotes above, your lines seem to be a bit too long and break awkwardly in CixRead (and probably some other OLR readers). Not as bad as those from Steve & Co, where the line goes to the screen edge and then breaks with loss of one character - a topic we are discussing in the Cheshunt Computer Club conference. Just because he is using some horrendously high resolution on his huge monitor.... :-)

Regards, /Peter/

>.
>I am doing the same here with QED. How does this turn out?

Hi Bob!

Like the above - a little too long at 82 chars which *just* fills my
640*480 screen in CixRead with just the point broken over to a new line.
(Don't know what the mailer will do with the quoted part; it had 5 lines
on arrival (should have been 4) but the quote chevron may muck this up.
Try using 72 or 75 chars/line, as I do in Everest.

as a long time atari dealer i must say that the milan was handled by
real pro's who knew just how jack would have handled it.
they were true to form, promising right up to the release, and then
shutting up.
then let the rumors fly thus turning enthusiasts into peecee buyers,
and relagating the rest to the doldrums.
at least they could release the milan in english to north America, that
might create a little profit, plus lots of goodwill, and exposure.
thanks,
lance

>
>Sorry, I don't know. I'll see if I can find something more about it.
>Anyway what's the problem with Photoline and magiC?

This from the "unofficial Photoline hyp":

. Note:
Photoline does not work correctly with MagiC 6 and NVDI 5
combination, as the palettes become corrupted. There is a way
around this though, configure Photoline to run in single mode, (at
least this works with Thing, but not MagX Desk).

Other choices are: reinstall MagiC 5.11; boot without MagiC into
TOS; use a MiNT/NAES set up (where this problem does't exist); or
run in single mode and lose the ability to use this hyp whilst
working with Photoline :(

The last solution is to use a different VDI, the NOVA one works
fine, so it may be worth trying fVDI.

The unofficial Photoline hyp from http://www.iipmail.demon.co.uk , by Nick
Ripley.

We are missing something here, this is/was a financial transaction between 2 companies

Denesh had no business airing the personal buisness problems of other indivuduals/companies in a public forum. he didnt jump into a public base and shout about his cyberstrider cheque storage scheme when he was costing people money in postage and phone call costs..

How would you like it if your utility companies published details of your affairs in here for all to see. Perhaps Titan would like to sue for damages occasioned by negligent disclosure of priveledged information, worth about 5 years inside i believe or some ï¿½200000 in restitution if proved. I'm sure Mr. Titan would be glad of the information in this message base archive to support his case.

And Denesh again took the opportunity to provide details of a business he has 'some' financial interest at the moment.

AVR is the Atari sound file format and as far as I know is only used the the SAM (System Audio Manager) software on the Falcon, SAM allows you to add sounds to functions like on boot-up, open/close file/folders/windows or deleteing files, like you can with Microsoft Windows (shudder).
SAM will also accecpt Windows WAV audio files as well as raw data (though it takes along time to process this, when I tried processing raw data I gave up waiting after 30 minutes).
SAM can also be used for basic recording functions so that you can record your own sounds using the Falcons DSP, IIRC it also allows you to save WAV as AVR and AVR as WAV files.

Hi Edward,

Contrary to the above, I wrote none of it!!! As far as Photoline goes,
it runs fine on both a Falcon,(the TT
version, because of my FPU) and a Milan, the ST version. Some Falcon JPG
viewers need the Brainstorm DSP auto prog. but I don't think Photoline's
one. Could be wrong though :))

Hi Edward,

I'm struggling with 14 Falcon and 20 Milan. On the Milan, Thing
or Ming, takes up a LOT of memory and Calamus will only run without
it in single task mode. Have tried making Thing unload when a program
is run, but so far get a fault message that desktop can't reload!!!
Will try your suggestions. The Calumus 2000 demo looks a wonderful
program.
I'm going to have to do some serious thinking, re which way to go.
Problem with color printing is, I was stupid and went and bought a high
end
HP 960C. Of course the only drivers are for a PC and Mac and none of

those
supplied for Layout eg 550C seem to work. It does work with Graftool
(wonderful
program!!!) and sometimes with Photoline, but generally I have the
feeling
that I have wasted nearly 200 quid and moreover it points up that the
peripheral
hardware coming up will be more and more inaccessable to atarians,
Hadians or
Milanians. In otherwords, we are a rapidly dying species :((

Bob King.

Hi Krzysztof,

probably no help at all, but if you just want a supply of AVR samples, I think
that the sound format conversion program 525 allows you to produce them from
other formats. Could be wrong though :))
I will check tonight and get back to you.

Bob King.

5401. Wanted: English MidiMaze II instructions

Newsgroup: comp.sys.atari.st
Date: 2000-11-08 00:00:00 UTC
From: Tim Knauf <shad0w_x@hotmail.com>
Message-ID: <shad0w_x-FA39AE.00281709112000@news.free.net.nz>
Source record: 54865

Does anyone know where I can find english instructions for the fantastic MidiMaze 2? My German is okay (I guess), but the wonky text encoding in the german file I found made sure that I couldn't get anything like the full meaning. I've worked out some of it (keys especially were a bit of a revelation after a week of my friends and I trying to push our way through the doors with brute force) - but I suspect I'm misunderstanding a few of the more interesting features. Any clues on where to look?

5402. Wanted: Substation (download or buy)

Newsgroup: comp.sys.atari.st

Free calls? You do want us to be around dontcha? I actually got asked
about this toward the end of last year, and I turned around and gave
loads of reasons as to why we would not go that route. I had even said
to many what would happen to those doing the free calls thing and the
general state of the market I correctly predicted in March last year...

Through all this Cyberstrider Limited has remained and only because of
our business model which is based on profit and traditional business
values in the main.

5406. Maximum RAM for Milan SIMMs

Newsgroup: comp.sys.atari.st
Date: 2000-11-08 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <3A0959F6.39ADB25D@patent.gov.uk>
Source record: 54870

Hi All,

Looking to increase the memory in my Milan. The manual (German) says, I think that you are limited as to how large the SIMMs can be in the 4 slots. Does any one know the maximum for each slot please.

BTW This typed and sent on a PC and Netscape etc and not using hard returns, just relying on soft returns. So how does it look in Atari readers?

Bob King

HTML is an absolute no-no in every non-WWW medium, be it mail, news or even IRC. Just because a Microsoft program has a real stupid default setting doesn't mean it's acceptable, but most often quite the opposite.

Have I said anything about agreements? At least in the EU, reverse engineering
is quite legal, and I think even disassembly is.
Without reverse-engineering, Linux would be without a lot of drivers, and the
*BSDs wouldn't be able to run on all those proprietary workstations.
As long as you use "virgins" for the reverse-engineering process, you can't go
wrong.

>they won't need to lose their existing software and using a common OS to all
>platforms makes file sharing/compatability so much easier.

Exactly, it's an operating environment and not an operating system. There will
be no AmigaOS, but in order to run "Amiga", you will have to run another OS.

>I don't see this as a bad thing.
>As for this not being an Amiga... I'd rather look forward then stick with
>old outdated unsupported technology like Amiga/Atari of today. I'm not alone
>here, just check the market share of those platforms...

Amiga Corp. could have updated and supported the existing AmigaOS, instead of
creating this new Java look-a-like. I haven't been an Amiga user these last
eight years because I wanted to run my programs on an anonymous portable
software layer, but because I like the AmigaOS.

>In any case, I'd rather look forward to face an uncertain future then be
>stuck in the distant past where there is no future.

They gave me the wrong future. IT is not only uncertain, but in a wholly
different direction. There is a gap between Amiga users and Amiga themselves,
and the fact is that we are only united though the name.

>could much more easily have been explained with a picture rather than
>text only.

You have no reason whatsoever to complain that you can't use HTML or pictures
in a newsgroup. You're simply barking up the wrong tree. Pictures and HTML are
the domain of the WWW.

>This also somewhat illustrates the problems with using an Atari on the
>net. The software and hardware just isn't keeping up. It's like trying

>25 8

>and that is all there is to it:-)

I compared it an Amiga adaptor I found at technick.net, and alas, the Amiga adaptor has the directions wired to the same spots, but gains ground from different pins (18/19), and while the 2nd joystick's fire button is wired to the same pin, the first one is wired to pin 13 as opposed to pin 1 on the Atari adapter. What a shame.

Not to mention availability and future security. Now you can't use ICQ, and no-one but ASH will help you.

>>Your perspective is rather limited. Certainly there are slick clients,
>>but a limited choice, and lacking compatibility.

>Compatibility with what?

With other stacks. Some clients use overlays for different stacks, while Mintnet can emulate the STiK layer.

>As for the limited choice... how many mailers, newsreaders, ftp apps..etc
>do you use? If a mailer does all one wants, why would he need to use ten
>others as well? as for looking slick... that's pure personal taste and not
>really relevant. The ASH clients take advantage of nearly all the modern
>GUI protocols developed over the years, if you call that slick....

Perhaps because this particular mailer does not suit my requirements? What if I like Teli and Fiffi, but like to use MyMail for mail and Newsie for news?

>>So why don't the superb ASH programs run with STiK, STiNG or MiNTnet?

>Because they are designed to take full advantage if IConnect, you'll probably
> argue that this is a lame excuse... Let me return the question... how many
>MiNTNet clients run with STIK, STiNG or even IConnect... and why?

MiNTNet specific clients are often of use mostly to MiNT systems. And MiNTNet was AFAIK the first stack, not counting KA9Q and other monstrosities.

>Compatibility is not really an item when you're talking stacks, nearly all
>clients run only on the stack they were written for. You'll probably argue
>that the IConect API isn't open source... MiNTNet API is open, so why are so
>few STiNG clients running on it?

MiNTNet has got GlueSTiK, so most STiK/STiNG clients will run on MiNTNet.

>>That argument is rather thin on the ground. ASH software is very slick,
>>granted, but also forms a system entirely of its own. You don't have much
>>of a choice. Id you want to run the emailer, you'll have to buy their

Right at the clock in to the DMA (pin 110) near inductor L66.
I have an inductor inline with the clock wire, and resistor in
series (110 ohm) tied to ground (pin 14 of U20). This value
may be different for your machine, I have a Nemesis installed.
Best way is to have an adjustable pot near that range and test
(many times:) your DMA (SCSI) performance and reliability. If it's
not right, you will lose data on devices connected to the SCSI.

Sometimes the FPU causes problems. The trace for the fpu clock is hard to
find, but is somehow tied to the DMA clock.
That's why I run the new DMA line, just to keep trouble shooting to a

mininum.

Also look at http://www.rjelwell.demon.co.uk/index.html for more info and links.

Hi

There was a problem with a bugged DMA on EARLY STE's but I've never had
any problems.

You can use any JEDEC-standard complying PS/2-style EDO SIMM between 4MB and
128MB. The Milan does not use parity, and it does not require correctly
wired presence detection/ID pins.

Note that there are lots of non-complying SIMMs out there, especially above
32MB, with 3.3V memory chips, partly defective chips etc..

You need one SIMM with at least 16MB in one block in slot 0 (ie. a 16MB or
larger SIMM with symmetric RAS/CAS mapping, bigger ones with asymmetric
mapping may work depending on mapping/size combination.)

>I'm not holding my breath though ;-)

So their box that has nothing to do with amiga runs a crappy emulation-style
OS that has nothing to do with AmigaOS. How is this an amiga?

>Sure, I like the AmigaOS also but realistically, AmigaOS is a bit beyond a
>simple update - it will require a complete rewrite from the ground up if it
>is to support most of the modern features that people expect.
>Problem is, Amiga Corp would need a lot of time and effort (read money) to
>do this and given the small market, this wouldn't be possible financially.

In other words, they have some piece of shit tech, which couldn't make a
name for itself, so they bought it. They should let the name die in peace,
if they aren't willing or are incapable of ressurecting it. Besides, what
most people expect in an OS was already there. The last 3 windows didn't add
groud-breaking cant-live-without features. It was prettier icons. AmigaOS
wouldn't take much to update if they wanted to... hell, open-source parts of
it, as far as that goes.

>Question then is, how compatible would such an OS likely to be and is an
>integrated emulation that is capable of running 98% of software and faster
>than any classic Amiga today is capable of really that unacceptable?
>(Bearing in mind that this question is somewhat hypothetical given that we
>don't actually know how well or how fast such an emulation would work)

Capable of running 98% ?This is marketing hype. 40% would be good, 30% more
likely. Besides, java has shown most people with a clue that this "we'll
write it so it runs anywhere" just doesn't work. That is totally opposite of
what we want... the merging of all platforms into one. It's happening
without Pseudamiga's help, and that is what killed the amiga in the first
place. I don't want that. That's like killing off all but one species of
wildlife, cause it's easier to care for. Heh. Then, there is the Pseudamiga
version, where their DE assimilates all wildlife species like John
Carpenter's Thing. No thank you.

>>They gave me the wrong future. IT is not only uncertain, but in a wholly

You like what Pseudamiga is doing, you mean. That's ok I guess, at the very least I would have been indifferent to them, if they hadn't stolen the name, and I might even have been interested. But they dealt a very low blow to us.

I don't think there exist a patch. AFAIK, it's something that you has to
do yourself. I'll see if I can find more info.

Now about Photoline and N_AES. It's amazing it won't run on your set up. I
don't say that it works perfect. There is a small redraw problem but on my
Hades using freeMiNT 1.15.10b/N.AES 2.0.0 Photoline 2.30 (both versions
but usualy I use the ST version) do work.

Hello Bob,

I actually had the same problem with Calamus when I first got it eventhough
I had 140meg of Ram. It seems I had to adjust the caches and virtual memory
inside Calamus before I got any color. Try printing simple color image
files and see how that goes. If Layout prints in color than I would think
you need more RAM.

There are some fun GEM games that can be played via the internet, check the
following for some recent examples:

http://gem.win.co.nz/mario/software/

http://www.atari-computer.de/thothy/stune/stune_en.html

SubStation, the "doom clone" for the STe, can be networked via midi and I
believe (not sure) that Running was considering adding network support, but
this will never happen now.
Furthermore, there were games, "modern" ones as you put it, that were (are?)
being developed for the Milan (I/II) that had planned on being tightly
integrated with online play, but I am unaware of their current status.

Yours, with sympathy and all blessings,
Bengy

Unless ofcourse you buy the new Amiga box that runs the AmigaDE natively,
which is something they intend to develop and it will, supposedly, be the
fastest AmigaDE implementation available (not suprisingly I guess) _and_ it
will be backwards compatible to a large extent.
I'm not holding my breath though ;-)

>software layer, but because I like the AmigaOS.

Sure, I like the AmigaOS also but realistically, AmigaOS is a bit beyond a simple update - it will require a complete rewrite from the ground up if it is to support most of the modern features that people expect.
Problem is, Amiga Corp would need a lot of time and effort (read money) to do this and given the small market, this wouldn't be possible financially.

Question then is, how compatible would such an OS likely to be and is an integrated emulation that is capable of running 98% of software and faster than any classic Amiga today is capable of really that unacceptable?
(Bearing in mind that this question is somewhat hypothetical given that we don't actually know how well or how fast such an emulation would work)

>>In any case, I'd rather look forward to face an uncertain future then be
>>stuck in the distant past where there is no future.
>
>They gave me the wrong future. IT is not only uncertain, but in a wholly

I like what Amiga are planning to do, but I share your view on this in that it has little to do with the Amiga name and concepts that current users are loyal to.

Regards,

Clockmeister.

ASH's Emailer is a bit of a law unto itself - despite the presence of
a line length setting in on of the Options menu, line wrapping seems
to rely on the size of the edit window. I therefore resize that window
to suit the length of the text that I'm quoting.

>Agreed. Just thought you might have some opinions on how that compatibility
>should be preserved.

You only have two choices: Build a new (Atari-unique) machine, or use an existing (non-Atari) machine. I thought we had pretty well established here that a hobby roll-your-own machine was realistically out of the question. So a new Atari will be a non-Atari computer (such as a PowerMac or AmigaOne, or even (ick) a peecee) with a 68K emulation layer to handle the old 68K binaries, some device drivers to handle the peripherals, and (hopefully eventually) a native TOS/GEM descendent like MiNT or Magic capable of running Atari apps recompiled for the new processor.

Hello there,

I recently bought one of the phenoix accelerators and was wondering
if anyone has installed a phenoix onto there falcons and if they had
any advice or pointers on installation, and if it works as well as
I've been told by the author it can :)

I must admit that i am pretty useless witha soldering iron so am
probably going to get an electrician in, unless anyone at the show
wants a go? :)

cheers

I've never even heard of this one - do you
mean Phantom? Hope it's more stable than
the Nemesis.

> I must admit that i am pretty useless witha soldering iron

Then you should have put your name on the
CT60 accelerator list.

> so am
> probably going to get an electrician in,
> unless anyone at the show
> wants a go? :)

Oh dear, you don't value your Falcon,
do you?

Make it into a competition. See who
can install it properly the quickest.
£5.00 a go. Then at the end you'll have
enough money for a CT60, or to replace
your Falcon should it get wrecked in
the proceedings.

In the meanwhile I received some info. Mind you that info is valable for
MagiCMac so I don't know if it will help you. Anyway here's the info:

**********START FILE**********

Firstly this person must avoid to try the TT version of the program, it will
NEVER work ....

> I recall me vaguely you talked about a patch. Do you know more about it?

Yes, I don't remember if I had to patch the Photoline program but maybe it's
the hint:
He must find inside GEMSYS/MAGIC/UTILITY/PCI_MAC/FPUPATCH.TOS
and by dragging this program to the related application, if the application
is written in C, the patch will create a new program usable under MagiC ...
That's all !

**********END FILE**********

Price quoted today £129 inc 4mb memory, mine are a little cheaper. I also have some of the Marpet standard upgrades.

Barrie at Keychange.

I now have a Falcon lined up, so I have for sale a couple of items...

First, an Atari STE. 4Mb RAM, RSVE 56K mod, 1.44 Floppy internal and external, switchable TOS 2.06. Powered by an external PC PSU, all cabled up properly but 'interesting' looking.

Assuming the Falcon all does what it should, this will also include an 80Mb HD in external case (powered from the same unit) and an ICD Link2, plus a fair bit of software. Unless Falcon's need different hardware, I will be keeping my Stereo Replay.

I'd like to get around ï¿½50 for it, but I appreciate it's a very kludged looking machine.

Also, Atari Jaguar with 5 games, 2 controllers, SCART. Say, ï¿½30 posted?

Swaps for Falcon items (I don't believe this has an internal HD, for example) are welcome.

Richard

> You were rubbishing someone in the name of your business for personal gain or to occasion harm, distress, actual damage to property, enterprise or personal standing of the Company of Titan.
> I bet his lawyers are gonna get on just great with yours.

1) I suggest you read the thread from start to finish. Someone asked a question about Titan designs. I pointed them to their official web site. Someone then posed a question about web hosting being expensive and I informed them that it was not expensive. Rather than people thinking our web hosting prices are expensive I duly informed people what the price was.

2) Titan are fully aware of what has happened to their web site. In fact they were informed of this time and again in advance of what would happen if they did not respond or pay. We had emailed them, fxed them and even sent letters to them.

3) You really think they can afford lawyers on something they can not win?

4) Read some trade mags. The tell me what you think of them.

Steve,

On North American Ataris, the left shift is wider and the key found between it and the Z-key on European keyboards is missing. In comparison with the UK keyboard, with which Australian Ataris were supplied, various symbols are moved around and the pound sign and the underline? on the key to the left of Backspace are omitted.

The Abacus Book "Atari ST Internals" has a diagram of the American keyboard.

|Everest is a text editor, were talking about mailers arent we??.

NEWSie uses an external text editor such as Everest to prepare the
text. I have the text length set to 68 characters (although I notice
that the "correct" length for a posting was said to be 70 - 75 or
some such.

AFAIK Steve is using "ASH Emailer" and this uses it's own editor to write mails. The line length though is set by Emailer itself rather than a user setting (Maybe wrong here - but it seems to override the setting which I think is just for reading incoming mail). ASH Emailer is 100% Atari so he can't really be critisized for not being Atari "aware" here, although Emailer does seem to transgress the RFC for line lengths - but only very slightly. Newsie requires a fix so that it/you can reformat incoming messages, as I personally know it's a real pain to get long one lined text when using it.

Try using Eudora on the PC to send your Atari friends using Newsie/CIXread messages then you *are* in big trouble!

Regards
Sean

>ps

Ah... yes,,! That will work great as a replacement for an ST floppy drive.

The idea behind Darek's 8-bit floppy drive cable was to use an existing 810 or 1050 8-bit floppy drive as a temporary ST drive, just to transfer files in the 8-bit disk format over to the ST.

I guess I should have asked the original poster what exactly it was he wanted to do with the 5 1/4 inch drive.

Your idea would be perfect if he wanted to read IBM formatted floppies, mine would be for reading 8-bit Atari formatted disks.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To make room for new stock, Bravo Sierra Computers is holding a YearEnd
Holiday Sale. Everything is 10%-30% off! Atari Orders for $50 and up
are 10% off, Orders $100 and up are 20% off and orders $150 and up are
30% off provided the customer claims the discount in E-Mail. This Sale
covers Atari Jaguar, 8-Bit & ST. This Sale does not cover Monitors.
Customer pays Shipping. So order now while supplies last. Get your free
Atari catalogs at: www.atari.benjamin.net or E-Mail atari@benjamin.net

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Hello, my name is Benjamin Smith. I'm a Collector & Jaguar Game Player.
With all my games to play, I have no one to play Games with on my Atari
Jaguar. I live in Portland, Oregon. USA and I'm looking for Atarians to
play Jaguar Games with. You don't necessarily have to have a Jaguar.
Most any Atari will do. I'm thinking of starting Atari meetings in
Portland. Focused on Gaming but still supporting any Ataris. Call Ben
anytime at (503)256-9974 or E-Mail:

e-mail: atari@benjamin.net

If I'm unable to answer, leave a message and I'll call you back.

If you want an instant answer try the
telephone. As an end user you don't realise
the volume of email businesses must deal with
(maybe you do, I don't know) so maybe it is
just a busy time. You didn't say how long
you have waited for a reply.

You can't just put a SCSI card in a Milan.
The driver software must be matched to
your motherboard serial number. It must
be pre-ordered.

You can't make that judgement without
knowing the condition of the machine or
what modifications have been done. Spend
£150 on a duffer and you'll certainly end up
paying more than £200 in the long run to get
it up to spec.

Depends what you do. I still find it amazing
Atari ever even considered let alone actually
released a 1MB version. 4MB boards are
easy to come across because so many people
found this too restrictive.

> How expensive and hard to obtain is the extra RAM if
> this turns out to be the case?

You can easily get a PS/2 SIMM
adaptor, and you get what you pay
for. Avoid the ones which take
30-pin SIMMs at all costs. Some are
unstable, and none of them work
properly with accelerators.

Hi Shiuming,

Thanks for the info. I don't remember seeing their telephone number on
any of their web pages. That's the problem with web pages, it's all
e-mail addresses or nothing, the human race could end up with no ears,
just finger tips!!

From what you say, it's too late anyway. I assume the matching bit is
because of changes in motherboard revisions.

If the CT60 comes off, I will probably drop the Milan altogether, so
perhaps it's fortunate I could be saving money.

Bob King.

Hi Peter,

the fold overs are as a result of my hard returns when writing in my
PC/Netscape editor. I have established that the editor does not require
hard returns and this should stop. I have also set my auto line format
to 73 for qed.

At the risk of being accused of having no brain cells at all, might I
humbley suggest that Steve drops Everest and uses qed. If I, of so few
brain cells can do it, I am sure he can.

emulation-style
>OS that has nothing to do with AmigaOS. How is this an amiga?

Beyond the name, not an Amiga at all except for having been designed by
longtime Amigans. They use this arguement a lot in their correspondence, but
it's an emotive response to a question they have no real answer for.

>
>>Sure, I like the AmigaOS also but realistically, AmigaOS is a bit beyond a

of
>it, as far as that goes.

3.5 added pretty icons, internet access and some other usefull features
including PPC support... didn't sell too well though I heard. Open sourcing
the classic AmigaOS is the one thing that would benefit the whole classic
Amiga using community, and could possibly increase the developer/user
numbers.
But it isn't going to happen anytime soon :-(
```

>>Question then is, how compatible would such an OS likely to be and is an
>>integrated emulation that is capable of running 98% of software and faster

>likely. Besides, java has shown most people with a clue that this "we'll
>write it so it runs anywhere" just doesn't work.

As I understand it, the AmigaDE will use a virtual processor not a
multiplatform language. Java is a mess IMO, not helped by the attempted
bastardization by certain megacorp.

That is totally opposite of
>what we want... the merging of all platforms into one. It's happening
>without Pseudamiga's help, and that is what killed the amiga in the first
>place. I don't want that. That's like killing off all but one species of

>version, where their DE assimilates all wildlife species like John
>Carpenter's Thing. No thank you.

Having the option is a good thing IMO, because compatibility alone isn't
going to carry MS any longer, they are going to have to deliver quality
products. (I know, I know... as if)

>>>They gave me the wrong future. IT is not only uncertain, but in a wholly

us.
>

The one thing that pissed me off was the use of Jay Miner's good name in the
initial propaganda for the AmigaOne... I found that cheap stunt rather
offensive.

Despite that, I still think their project is interesting, but aspects of
their conduct regarding the current Amiga userbase (which includes myself

incidentally, I still use my 2000HD, superhacked A1000 and hacked A500 on a regular basis) is disappointing to say the least.

I think we can at least agree on some of these points ;-)

Regards,

Clockmeister.

Well I intend to keep notes and such, maybe make a hyp or something
on the hades someday. As for progress, this is day #3 and my case,
floppy, and HD have not arrived yet. lol

I had hoped to get it up and running before my birthday which is today.

OK so we've got mini-microwave transmitters passing data from one bus
to another on the motherboard huh?

Gee, why didn't they think of this years ago!

Probably because its sillier than Monty Python! (but almost as
entertaining to read about!!)

Kind regards,

FOR SALE - IT'S A BARGAIN!

For sale: Atari STE 520 computer. Fully working order with stand and mouse. Great music computer as has built-in MIDI ports. Can be hooked up at quite low cost to a hard drive, a second disk drive, a printer and a modem. Vast software availability out there on the net and elsewhere.

A great low-cost and easy-to-use computer which would really benefit someone who wants to get into computer sequencing but hasn't a load of cash. It's yours for just 30 UK pounds. Buyer collects - sw London/Surrey area.

Also: Atari monchrome monitor, not working (small, inexpensive repair needed), free to a good home or can bundle with STE 520.

Give me a shout at sonik@wearelondon.fsnet.co.uk soon!

Cheers :)
Al

> STiK2?
>

Hi. Thanks for responding. As I understand it - correct me if I'm wrong -
all three packages use different interface s/w ie Wensuites is built in,
Draconis has its own accessory although Cab has a selection (I have
Iconnect). They ALL crash so it wouldn't appear that the i/f software is to
blame. One possibility is HSMODEM6 which all three need. Is there an
alternative available? This bus error (-#69 under Magic) seems to be common
with lots of other s/w too, Fcopypro springs to mind. When I set the bus
configuration to STE using FalcSX this allows Fcopypro to run and I've found
that the browsers crash less frequently as well, though they all still crash
far too often. And none of this explains why Wensuite refuses to load certain
sites!!! I'm desperate to get this resolved as it's rapidly becoming too much
hassle to be worth the bother...

>included with the upgrade as well.

I have use Tiger and KCS on my ST/STe along with my MT-32 midi module. They worked out great. However they do not run on my Hades 060. I still use them when I run my STe and they still perform well. I also have TigerCub which also performs well on my STe, but not on my Hades. I am hoping someday I will get them to run on my Hades, but for now I use Sweet-16. Dr. T's software is fun and easy to use. Too bad he is not supporting the Atari computer anymore.

Since you don't know what your brother's PC had been doing to that modem
behind his back, I'd suggest resetting it to factory default with at&f

You should find that does the trick. Then you might have to do a few tweaks to
get it to report connect speed rather than the DTE rate etc, once happy save
it back to user profile 0.

No need to turn compression off.

I use KCS on my TT030. It won't work in any other rezes beside ST Hi
ans ST med. It does not support the higher rezes. Try that.

I still use them
> when I run my STe and they still perform well. I also have TigerCub

It can get quite deep as well. Still figuring out it's finer points
like control sequences.

Too bad he is not supporting the Atari
> computer anymore.

He is not programming for Atari, but at least he is making available
his KCS package and with a lot of cohearsing (from me) he finally
released KCS and TigerCub to have on my site. He also has an
interesting program called MidiAxe which is an extension of Fingers.
Uses the Mouse as an interactive part of the performance. I might get
that someday.

Tim

5548. AMS 2000 is happening!

Newsgroup: comp.sys.atari.st
Date: 2000-11-10 00:00:00 UTC
From: Simon Osborne <atariactive@crap.btinternet.com>
Message-ID: <8uhkbh$1u5hk$1@ID-59683.news.dfncis.de>
Source record: 54729

Due to a number of queries regarding the show going ahead, Sharward have sent out the following mail:

We've had a number of enquiries checking the event will go ahead and it's definitely on!
Happily Bingley Hall, at the Stafford County Showground is on a hill and the free car parking areas are all fine when we spoke to them today.
Most traders pay in advance for their stand so they'll be there so please come along and make the event as successful as usual.

There is some local flooding in Stafford so if you're traveling by car via the M6 use junction 14 do NOT use junction 13 or avoid the centre of Stafford if at all possible.

We look forward to seeing you all Saturday.

I can confirm that it is, and that it doesn't :-(((

However, neither did my GS 850 - maybe I need more than a bike and a computer if I'm going to attract the girls at my age !!

Cheers

Paul

Since the docs are very limited, and in german I figured tips
on building one from scratch would be a good starting point.
I think also documenting all the cables/connectors would be
good too, some of them are custom made for the hades and
something you cannot get at some PC shop. At least 2 of them
for sure would have to be built by hand if one ever had to
replace them.

> >on the hades someday. As for progress, this is day #3 and my case,

That suprised me too. Now it's Friday and my stuff is still not
here so it's going to be a long weekend. ;-P

Thanks.

It still is somewhat a nice thing anyway, since about 1997 or
1998 at an Atari show when I saw a Hades060 actually running
I had wanted one. Even though it's not running atm, I am
very happy regardless.

Hello,

Is there any significant difference between the ram board sold by
wizztronics and the one sold by wbsystemtechnik in Germany?
(14 meg ram)

Would this slow down the operation speed of some programs?
(I have read about this happening to one person before)

If you put the simms in yourself, is there soldering involved?

thanks

ken

It is an image converting tool that handles 200 or so formats, free and
there is a version for almost every platform. For the PC and a lot of other
platforms/ operating systems there is also a viewer/ converter / modifier
that works in over a dozen languages

Source record: 54703
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.8-bit,alt.atari

once again, it's time for the famous Toronto Atari Federation Flea market!

yes, on Thursday, November 16th from 7-10 PM, come in and see what there is to offer in all things Atari! Looking for hardware, software, or a rare item? Chances are you'll find it here! Need to sell something? You can do the same here as well, we supply the tables! Sell your old stuff, find yourself a treasure! And do so while rubbing elbows and talking with fellow Atari users!

Ken Macdonald will be there to demonstrate and sell the latest in Mario Becroft's products for utilizing modern hardware on your classic Atari, from mouse and SVGA adaptors to the new multi-outlet MIDI device to the QWERTY-X keyboard/mouse adaptor. We hear he may even demo some software on his tricked-out Falcon.

Dan Dreibelbis will be there as well - he's got his photos back from his New York City vacation, and he'll be showing them off with some interesting commentary on what went down.

Please note: as always, TAF does not support piracy or selling stolen goods. Anyone attempting to sell stolen software and hardware at a TAF Flea Market will be dealt with within the full extent of the law!

So come in and be prepared to sell, buy and browse, and have a grand old time at the Flea Market! See you there!

The TAF meeting will be held in the Silver Room underneath the library in North York Centre at 5120 Yonge Street - parking facilities available within the Centre. Those who wish to take public transit can take the York/University/Spadina line to North York Centre Station.

More Info:

Ken Macdonald , president - anarkist@idirect.com
Dan Dreibelbis, VP - dreibel@idirect.com

5568. Need modem help

Newsgroup: comp.sys.atari.st
Date: 2000-11-10 04:15:30 UTC
From: taj16@dreamscape.com
Message-ID: <t0mtj28c54cf34@corp.supernews.com>
Source record: 54704

I'm currently using a Mega STE and an AT&T Dataport 14.4 modem with HSModem7, STinG 1.22, Newsie 0.94, and CAB 2.7. The Mega STE serial port can be used at speeds of up to 38.4K.

My brother gave me a Hayes Accura 336 V.34+FAX modem after picking up an almost-free-after-rebate 56K modem. Unfortunately, he never had a manual for the Hayes, just used the factory settings on his PC. I tried looking for a manual on the web, and found one for the Accura 288. However, a little investigation turned up enough inconsistancies between the default settings in that manual and those of this modem, so as to make it nearly useless.

Can anyone help me with setting this modem? I imagine compression should be turned off, but that particular S-register is one of the places where the downloaded manual disagrees with the modem - if that S-register indeed still performs that function. Every modem I've had faster than 300 baud has had to have a bit of tweaking before I could get it to work properly with the Atari I was using at the time, and I imagine this one will be no exception.

5569. KCS Omega Ver 4 on TAMW

Newsgroup: comp.sys.atari.st
Date: 2000-11-10 04:58:09 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8ufv8v$6m1$1@nnrp1.deja.com>
Source record: 54705

Hello All:

Just got KCS Omega ver 4.0 Midi sequencer released as Shareware from Dr T (Emile Tobenfeld) This was a version that was on an ST Format Cover disc a while back, which is now on the ST Format site in .ST extension. But then I asked the Dr if he would make an Official release and he said YES. So it is on my site on the DOWNLOAD PAGE and the OMEGA II KCS page. see sig.

This version comes with TIGER and QUICKSCORE (released from Tiger Cub). There are also some MPE programs on my site you can use with KCS and that is TUNESMITH and COPYIST. So anything you do in TYunesmith is copied over in realtime to a KCS sequence track. Pretty cool stuff.

This version is still very powerful, especially in OPEN mode where you can have 128 sequences ready to play from the qwerty keyboard. But if you want the FULL version with more MPE modules (Like the Mixer and Song Editor)and the much-talked -about PVG and Master Editor modules, then you need to contact the doctor for the Upgrade.The manual is also included with the upgrade as well.

I would appreciate any comments on these applications or if anyone here is a KCS user.

Tim Conrardy

it
> >was due to the fact that they hadn't paid for their site Hosting for over
a
> >year
>
> We are missing something here, this is/was a financial transaction between
2 companies

Not if you read the whole thread. If you do, you'll see that it was based on a couple of questions that Denesh happened to reply to. Sort out the real issues and stop complaining about when people tell the truth here.

> Denesh had no business airing the personal buisness problems of other
indivuduals/companies in a public forum. he didnt jump into a public base
and shout about his cyberstrider cheque storage scheme when he was costing
people money in postage and phone call costs..

So you're saying that if someone has been ripped off by a company and tried to get it sorted out for over a year without success, they shouldn't tell people about it, to prevent others from being ripped off?
If Denesh has done wrong in the past, he's been critizised for it in this forum when it happened - and that's probably been justified then, but now you're saying that criticism against Titan shouldn't be aired? Where's the logic in that?

> How would you like it if your utility companies published details of your
affairs in here for all to see. Perhaps Titan would like to sue for damages
occasioned by negligent disclosure of priveledged information, worth about 5
years inside i believe or some ï¿½200000 in restitution if proved. I'm sure
Mr. Titan would be glad of the information in this message base archive to
support his case.

Get real! Priviliged information? No way! It's been a simple statement of the facts why their site was closed down, which is absolutely no secret. The

damage has been made by Titan themselves by not paying what they owe and not meeting the criticism that's arised. When they can't pay for the essentials (a website) - which any private person would afford - they obviously can't be trusted when doing business with them. How would they afford to keep warranty commitments to their customers if they can't afford paying for their website? How would they afford to develop hardware they claim to develop?
If I'd been ripped off by a company - either personally or professionally - I'd also tell people when they asked me. Mind you that Denesh has tried contacting them for a very long time about the payment, without replies until the site really was shut down - and they haven't paid for over a year! This means they ignore any problems - what confidence do you get then if you plan on buying something? Will you also be ignored when you send something for warranty repairs? This is a very important issue!
I find it a bit strange that noone from Titan has met the criticism... If both them and Denesh would have given their views on the matter, it might have been a little easier to understand - but maybe they don't dare since they know they've done wrong? I also find it strange if an Atari focused company don't read this newsgroup, as it's the largest Atari group around and monitoring it must be interesting for everyone doing business with Atari products - does this reflect their actual interest in Atari stuff? Maybe it's time to look for others who hold the Atari flag up a little higher instead of defending a company that rips off their supplier?

> And Denesh again took the opportunity to provide details of a business he has 'some' financial interest at the moment.

Provide details? Why not? It's of common interest when a company rips off customers or suppliers!!! Besides, they've taken advantage of Denesh's dedication to Atari and told him to ignore the payment issue... VERY strange company indeed! I wonder who should be suing who...?

> > There was a problem with a bugged DMA on EARLY STE's but I've never had
> > any problems.

> I think the ATARI drives work fine, it was the third party ones (like
mine)
> that had trouble.

Nope! The faulty DMA chip was actually the model that should have been used only for the ST and not for the STe. It was mounted in a large number of STe's by mistake - and it messes up the FAT of _all_ HD's :(Mostly, you won't notice it immediately - but try to save a lot of files on the HD and defragment it after making some deletions, so it has to work a lot with the FAT, and you'll see if the files are messed up after the operation, so you'll have to re-partition the drive (and exchange the faulty DMA-chip)... Many STe's were ok though - but I don't think there's any certain way to tell which ones are. You have to open the case and check out which DMA chip is mounted in yours.

: Hi there!

: Anybody knows the good 3D Modelling/Rendering software ?
: I mean not unix native but TOS/GEM compatible,
: working under TT 030.

POV-Ray is a good raytracer. There are GEM versions around.

There is a GEM modeller that supports POV-Ray called EB-MODEL (or
something similar) from France. Last time I used it, it was quite buggy,
but that was a while ago. It looked like it had potential.

A good integrated GEM modeller and raytracer from what I hear is Inshape 2
(not version 1). I have never been able to find a copy of Inshape 2
anywhere. I would love to see it.

Well the mouse was a Logitech Pilot Mouse (lower end of the logitech
mice). The mouse seems to be rather odd as it uses some pins on the
ps2 port that, according to the ps2 specs should be disconnected. The
adpator isn't generic either, it seems to be made especilly for that
model of mouse.

>BTW, Jo Even Skarstein's comments on how PS/2 to serial "adapters" work

Hi,

You can find on my Atari dedicated page a program called GEM Mid2Mod
that converts MIDI files to MOD files.

My page is in french but an english documentation is available online.

http://perso.wanado.fr/ckb/atari.html

Clement

'Allo.

I've confirmed and arranged my new Falcon system, and one of the goodies with it is a co-processor which hasn't been fitted. The seller says he didn't bother, since he'd heard from someone who broke their PCB trying to install it.

What are the benefits for me, if any, using a Falcon for music (MIDI, mainly, but some sampled stuff). Is it worth the risk?

Is there a real risk, or was the PCB-cracker just careless?

Does it affect anything else - like the graphics performance?

Richard

If you mean the FPU then it's very easy to install and I can't see why the PCB would break. Some demos require an FPU and it greatly speeds up Raytracing and other 3D apps. I can't see it affecting music in any way.

From: tcjspencer@zetnet.co.uk
Message-ID: <3a0dd2ef$0$180@news.zetnet.co.uk>
Source record: 54677

Is there a later version of this? I've used it to archive some large folders and now it crashes the system totally when I try to unpack them.

I have found STZIP a bit dodgy in the past so I now use LZHSHELL 3.1 as I've found that to be completely stable on my system and I was hoping to transfer the .zip files to .lzh instead.

No. Plug & Play. Both.

> Would this slow down the operation speed of some programs?
> (I have read about this happening to one person before)

No, why should that do?
Longer time need the falcon ram test if you use it.
More ram needs more time to test.
(Only on cold reset)

> If you put the simms in yourself, is there soldering involved?

No. Completey solder less handling.
With carefull fitting any card would be work finde.

Use one of them in any of my falcons.

More about Falcon ram expansion -> DOITF030

That's unbelievable.

> What are the benefits for me, if any, using a Falcon for music (MIDI,
> mainly, but some sampled stuff). Is it worth the risk?

SoundPool's audio software will benefit,
and the forthcoming DSP software synth,
ACE, from New Beat, *requires* FPU
(and absolutely stonkingly good it is,
too, I can report). No MIDI sequencer
will benefit.

> Is there a real risk, or was the PCB-cracker just careless?

Very.

> Does it affect anything else - like the graphics performance?

No. It will only accelerate programs
designed to use it.

>

I've been looking for something like this for years. I once heard
rumours of a good 3D modeller, I think it was Inshape but I was
never able to find it.

Anyway, I spent a little while downloading and trying EB Model.
It looks great and has loads of things to configure but so far
I have not been able to get it to generate a POV script or
to start POV with the correct script path. The application is
in English, which is curious given its French origin but the
html help is in French and its been so long since I studied
French.

I gather that the demo has restrictions but it is definately
worth a look to anyone interested in raytracing, I just dabble
occasionally.

Hmm. In the bright blue navigation bar
at the top, you should see, "Contact"
which links to a lot of useful information.

> That's the problem with web pages, it's all
> e-mail addresses or nothing, the human race could end up with no ears,
> just finger tips!!

Some companies do that on purpose
so they don't have to get all the time
wasters, but it's often unhelpful. At the
moment I'm trying to find an address
for FedEx so I can give them grief
over a delivery that was a week late
due to being mis-directed several times.

> From what you say, it's too late anyway. I assume the matching bit is

I don't think so. More likely to be
an anti-piracy measure.

many people use 72 colums. Reason? Punched cards had 80 colums and
the last 8 colums were universally used for numbering. (ever dropped
500 of those cards?)

> that?

I see where you're coming from, but at
the time of the original IBM PC, that
was really a huge amount of RAM
(certainly compared to the 8-bit home
micros of the era) and suitably-matched
to the architecture and software.

At least the Falcon had the ability to
use a far higher capacity. 1MB for
an advanced (at the time) sound and
graphics machine with multi-tasking
potential is seriously inadequate. I would
guess it had more to do with price
than anything, but then I'm sure anyone
with any sense would have seen how
useless 1MB would be. That was
tight for an ST (as far as serious use
is concerned), never mind Falcon.

<tcjspencer@zetnet.co.uk> writes
>Is there a later version of this? I've used it to archive some large
>folders and now it crashes the system totally when I try to unpack them.

IIRC I had a similar problem if a folder had 300m or more, files.
Sometimes the system locked, when packing/unpacking the folders, and
sometimes it crashed when opening the archive.

Try using the ZIP.TTP version to extract the files. I used that and
quite often that would work where STZIP failed.

>I have found STZIP a bit dodgy in the past so I now use LZHSHELL 3.1 as
>I've found that to be completely stable on my system and I was hoping to
>transfer the .zip files to .lzh instead.

Quick tip if you're using Magic and LZHSHELL. If you change the strings
"MiNT" to "MagX" in the .APP it will become "LFN-aware". The reason for
this is it searches for the MiNT cookie and, once patched, will work as
if it was running under MiNT.

In the version I have, v3.10 with a file size of 169829 bytes, the
offsets that require altering are:

127774 (0x1f31e)
156850 (0x264b2)

5622. Undeletable files/folders

Newsgroup: comp.sys.atari.st
Date: 2000-11-12 00:00:00 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <8umkej$pm1$1@plutonium.compulink.co.uk>
Source record: 54620

Some time ago there was discussion here (or in an atari conference on Cix) about a problem in deleting files/folders from a drive.

I have just had a similar problem, whoses solution may be of use to others: I had coppied a folder www.scooter-pcb.de from my CAB folder, which is on a partition with LFN enabled, to another partition that was DOS 8+3 only. This showed up as WWW-SCOO..DE in the copy, and while the folder could be opened normally by double-clicking on it, and the files in it were OK, when I tried to obtain Info about its length, and later to delete it, this was refused with an error message that the 'File can not be read (TOS -33)', meaning 'File not found'.

The problem was the two dots, which aren't allowed on 8+3 file systems. Only after I used VFATCONF to activate long file names on the partition temporarily could I access the folder info; renaming it to one dot and switching off LFN again allowed the info to be accessed and deleted under 8+3 as well.

So if you have problems deleting a file or folder that has an unusual name, enable LFNs temporarily for the partition.

Regards, /Peter/

Also not too long lines reads much better then very long lines. That's
for instance the reason why magazines uses a two or more columns
lay-out.

If you have ramfs.xdd in your /mint or /multitos folder, try to remove it. At least I know that kernel 1.15.10b has ramdisk built in, and might conflict with the xdd one. Other than that, just try to remove xfs or xdd's until you find out which cause the prob.

>

I've used STZIP 2.6 without problems on my Falcon, but usually use
ZIPJR within the 2-in-1 shell, which also has access to other compress
algorithms such as LZH, ZOO, ARC, UNARJ etc. Never had a stability
problem, running MagiC, NVDI, Nemesis.

It is possible to connect an Atari to a standard SVGA monitor by
building a cable with an Atari monitor DIN in one end and a SVGA plug
and phono cable in the other. I once bought such a cable.
But what is the pin-lineout?
I have tried to download drawings from Atari FTP servers, but they
only count for Falcon - SVGA!

Cheers Feddersen

5629. UK STFM price

Newsgroup: comp.sys.atari.st

Hello.

I bought a working STFM with 1 MB RAM recently for £1.

What is the going rate for one of these. Is this a bargain?

The ST is a really great machine!

Alex Taylor.

5630. NVDI compatible with Winston ?

Just tried WinSton 0.4 emulator but couldnt get it to work with NVD?

So is it compatible or have I got wrong settings somewhere?

Thanks

Norm

: many people use 72 colums. Reason? Punched cards had 80 colums and
: the last 8 colums were universally used for numbering. (ever dropped
: 500 of those cards?)

123456789012345678901234567890123456789012345678901234567890123456789012345

Yes, I have dropped that many cards, and more, doing program copy
maintenance for a bank.

My copy of Zen and the Art of Internet, printed, is in hiding at
the moment, but that is where I got the number of 65, which
allows several layers of quoting before it no longer fits on an
80 character screen.

Not everybody gets quoted only four times. If you want what you
wrote to be read, allow for several levels of quoting.

Alex,

That is a great price for the STFM. In the US the going price is about $10. If you purchase it on ebay then the price would be around $40-60 USD.

Don

```
... little big competition
... The Atari Three In One.
... dedication. skill. creativity.
... http://www.magicos.de/lbc.html

sponsored by: st-computer +++ Paskud +++ AtariFan +++ Therapy Seriouz
Software +++ DurSoft +++ Patrick Eickhoff +++ Triple a Mag +++ Woller GmbH
+++ Didier Mequignon +++ RGF Software +++ Application Systems Heidelberg
+++ Mario Becroft +++ More to come!

1 .: introduction

Following the enormous success of last years MagiC Game Contest, MagiC
Online and the place2be are proud to present their next generation
competition, that will once again unite the existing community and breathe
new life into the Atari platform.
This year the organizers are able to provide not just one contest, but
three. Besides two coding contests, the "Little Big Competition" also
features a special graphics contest in cooperation with the Atari Icon
Library.

Dedication, Skill and Creativity. The Atari 3 In One.

2 .: big ports, little helpers and a new look

We have decided to split this years contest into three categories.

.. big ports

The aim of this contest is to create the best possible software port
to the Atari platform. There is an abundant amount of quality software
packages available, complete with sources, waiting to be ported to our
platform. Why not take the challenge to create the best possible Atari
version?

- see rules for the exact requirements of the port

.. little helpers

The aim of this contest is to create a (relatively) small and useful tool
or
utility; a program which simplifies everyday use and/or increases overall
productivity. Interested entrants may examine features from other
platforms, deciding to merge the best features of these systems with the
elegance of the Atari environment. More Creative participants may choose to
implement their own innovations; innovations that will dramatically increase
the ease of use and/or efficiency of certain tasks. Will you be the one who
revolutionizes the Atari platform?
```

- see rules for the exact requirements of the tool/utility

.. a new look

Every user is not a skilled programmer; but every user is equally important
to the survival of our platform. This contest celebrates this fact by encouraging the use of artistic and aesthetic skill: to create a modern new look for the "Atari Desktop 2001". For a long time, the Atari desktop has been a eclectic mixture of Icon Sets, background pictures, and winframes which were mainly adapted from other platforms. Our aim is to create a new coherent and original looking desktop. So here's the plan:

- icon set
Originally, the Milan II had planned on introducing Glow Icons to the Atari
platform, but now it's up to us. The first part of the Atari Desktop 2001 competition is to create the best looking set of glow icons. If you are not familiar with this style, you are encouraged to view the sample images of some Amiga conversions on the compo-pages. (Courtesy of Joachim Fornallaz)

- background pictures
Create the best looking background picture for use in our favorite Atari desktops.

- winframes
N.AES 2 and MagiC 6 both introduced the possibility to change the appearance of the window elements by using winframes. So the aim is to create the best looking winframe.

- see rules for the new look contest for the exact requirements

Any individual who wants to take part can contribute to one of the subcontests mentioned above. You don't have to create an icon set, background picture(s) and winframe(s). At the end of the contest the Atari Community will separately vote for the best icon set, picture and winframe. After that we will compile a package out of the best contributions (and possibly fill in some Amiga glow icons, which otherwise might be missing) into the "Atari Desktop 2001" package. All icon sets will be added to the Atari Icon Library.

3 .: little big sponsors

Our contest wouldn't be possible without the kind help of our sponsors. Here is the place to say thank you and introduce:

st-computer (http://www.st-computer.net/)
st-computer is the largest Atari computer magazine in circulation. With a full-color layout, professional staff, and a generous spirit; st-computer is truly a winner.

Paskud - Grzegorz Pancher (http://www.rsi.pl/paskud/)
Grzegorz Pancher is a popular musician who has utilized the powerful elegance of the ST in a Studio-setup to produce some very popular polish CD's. He shares his passion for Atari computers with others by producing

and selling several products, (including an IDE interface for the ST and Falcon RAM cards) and servicing Atari computers. "Paskud" has generously sponsored (5) of his ST IDE interfaces (for HDD and CD-ROM).

AtariFan (http://atari-fan.idz.pl/)
AtariFan is the premiere Polish magazine that has already established a proud name for itself, even in its infancy. They are kindly sponsoring a free subscription of AtariFan for the year 2001 with a free CD.

Therapy Seriouz Software (http://www.therapy-seriouz.de/)
Therapy Seriouz Software are the developers of Smurf, the graphic manipulation program that blows away its counterparts in both functions and speed. They are kindly sponsoring one full copy of Smurf.

DurSoft (http://dursoft.atari-computer.de/)
DurSoft Developments has made it possible for all Atari computers to take advantage and utilize Digital Cameras. By packing features into PhotoTip, DurSoft has provided all of us with the definition of quality software. DurSoft is supporting us with one full copy of PhotoTip
By packing features into PhotoTip, DurSoft has provided all of us with the definition of quality software. DurSoft is supporting us with the one full copy of PhotoTip.

Patrick Eickhoff (http://funmedia.atari-computer.de/)
Patrick Eickhoff is the developer of the great multimedia tool FunMedia. It has been in development for some years now and proves that you do not have to stray away from the Atari platform to have access to innovative multimedia tools. Patrick is kindly sponsoring one full copy of FunMedia (on CD)

Triple A Mag (http://www.triple-a-mag.de/)
Triple A Mag, the once Atari-only magazine, has recently expanded its horizons and now covers the Amiga, Atari, and Acorn platforms. Their attention to detail and support is outstanding, and so are their contributions to this competition. Triple A is supporting us with 100 DM in prize money and 3 full subscriptions.

rgf Software (http://www.rgfsoft.com/)
Richard Gordon Faika is one of the most active Shareware authors for the Atari platform. Tools like Arthur or the outstanding editor Luna are in daily use by many Atarians. Richard sponsors two "Moon"-Packages which include Arthur 2000 (+ all libraries), the latest Luna version and the latest release of the Luna Text Compiler. Worth 174 DM!

woller systems (http://www.woller.com/)
woller systems is a well respected Atari dealer as well as the initiator of many new products for our platform. Some of their products are: N.AES, GEM-TV Milan, Milanblaster. Like last year woller is generously sponsoring 3 copies of N.AES.

Application Systems Heidelberg (http://www.application-systems.de/)
Information pending

Mario Becroft (http://gem.win.co.nz/mario/) Mario is the well known hardware (and software) developer that continues to release must-have products at affordable prices. Whether it's connecting a PC keyboard to your ST or adding some extra Midi ports, Mario has just what you need. Mario kindly supports us this year with one Atari and Amiga serial mouse interface.

Didier Mequignon (http://perso.wanadoo.fr/didierm/)
Didier is an extremely gifted programmer who constantly pushes our platform to the edge, as is evident with his many essential programs. AniPlayer, his main project, has introduced many users to the joys of multimedia movies and digital sound. Didier is showing his support with (3) registrations to Aniplayer.

We have not yet decided which prizes will be given to what contest. But we will keep you informed. If you would like to support us by sponsoring our contest then feel free to contact us!

4 .: registration and support

If you want to take part in one or more of the contests, then please register by filling out the form on the compo-pages. This is needed to decide whether to skip one of the contests or not. You have no obligations after registering, it is just for information purposes. It also helps to verify that no one works on the same port.

It is also possible to register for the contest as a team of people (to be able to finish bigger projects). Just enter the names of all team members separated by a comma into the registration form. Although you won't receive any help from us when it comes to deciding which team member gets what prize.;-)

Any individual can contribute with several productions to all three contests. It is possible to work for one or more teams and on one-man productions. Whatever, just be productive.;-)

If you register you also have the option to receive free newsletters from us, which keep you informed about the latest contest news (new sponsors etc.).

This year we are also able to offer a free translation service to all our contestants (kindly provided by TransAction and DDP). This way we can assure that the user interface (probably even the manual) of all contributions is available in all major languages.

If you need beta-testers (with a certain system configuration), feel free to contact us and we will see what we can do.

5 .: rules

.. contributions

big ports and little helpers
- All programs must state that they were "Produced for the "Little Big Competition" both in the readme's and Info Box!
- Programs may be shareware but may not be crippled in any way.

- Programs have to work under both MagiC and N.AES (2).
TOS support is optional.
- using extended MagiC objects is allowed as N.AES 2 supports them.
- Programs can make full use of system extensions which are freely
available. We even encourage you to make your contributions support
modern features like BubbleGEM, OLGA etc.
- Programs may make full use of NVDI 5's extended VDI calls
- Programs which need network/internet support of some kind may use every
TCP/IP stack available for the Atari (STiK/STinG or MiNT/MagiCNet
preferred).
- Porting a software may also include reprogramming a software (big ports)
- A port should either feature a GEM-interface or shell (exception:
e.g. games running in fullscreen mode - VDI output still required of
course). Contact us if you are unsure. (big ports)
- system requirements can be set freely (minimum processor, RAM,
resolution etc.). Note: People who can't use your software
won't be able to rate it. On the other hand people who see software
pushing their 060 to the limit might be very happy and give high rates
to your software.
- Adding hardware specific parts (e.g. direct screen access) is
only allowed as an optional feature to speed things up on original Atari
hardware.

new look
- the icon set needs at least 12 entries
- icon sets must offer 2, 16 and 256 colour versions of their icons
- 16 and 256 colour versions have to glow
- other animated features are optional
- NVDI 5 palette has to be used
- icons have to be your original artwork (no conversions from other
platforms!)

- background pictures can have any of the following standard sizes:
640*480, 800*608, 1024*768
(supporting several resolutions is welcomed)
- NVDI 5 palette has to be used for 16/256 colour pictures
- colour depth can range between 1-16 Bit
(supporting several colour depths is welcomed)
- pictures have to be your original artwork
(scanning is allowed)

- you have to create the winframe(s) for both MagiC and N.AES (2)
- see the example archive which contains a MagiC and N.AES winframe
- winframes must support all colour depths
- NVDI 5 palette has to be used
- winframes have to be your original artwork
(no conversions from other platforms!)
- Instead of making a standard MagiC winframe you can also make an
enhanced NatFrame winframe as NatFrame is free.

.. voting

An exact description and rules for the voting procedure will be included to the vote forms.

6 .: deadline

Deadline for all contributions is May 12th 2001. No contributions will be accepted after this date.

Contributions shouldn't be released before the deadline, otherwise we'll have to disqualify this entry.

Absolutely no contributions that are publicly released prior to the May 12th deadline will be accepted. This includes public "alpha" and "beta" releases. The aim of this competition is to spark the creation of /new/ software and "themes" for our platform, therefor, no existing programs, icons, winframes, or Background images may be updated and entered into this competition. Failure to comply with this rule will ultimately result in disqualification. Entries may not be released prior to the deadline to ensure equality and fairness to everyone involved. All entries will have the same timeframe to be tested and voted upon. Furthermore, until the official closing of the competition and judging, ALL programs/sets will ONLY be available in a single archive. Individual downloads will be made available after this time. All contributions will be available for download on May 13th from the compo-pages.

7 .: the team behind this years contest

This years contest has dramatically grown in size and we are glad that some loyal Atarians offered us their support and help. So here is the place to introduce:

Bengy Collins (http://magicos.de/)
Co-Organizer Bengy Collins runs one of the largest English portal sites, Magicos.de. Bengy also has a monthly column in the German ST-Computer magazine. Co-Organizer of last years MGC 99.

Jan Daldrup (http://place2be.de/)
Jan Daldrup runs the largest International portal site, place2be.de. Jan works for the German st-computer magazine. Co-Organizer of last years MGC 99.

Joakim Hï¿½gberg (http://gokmase.atari.org/)
Co-Organizer of the "...new look" subcontest, Joakim is the Father of the "Atari Icon Library" and continues to prove beneficial to the Atari community by his continued work on essential utilities. Him and Dan Ackerman are currently working on aICQ.

Rafal Kawecki (http://kawecki.atari.org/)
Rafal is the webmaster of a popular Polish news page and will represent our contest in Poland. He translated the contest pages, kindly provided us with sponsors and manages the contact with Polish authors.

st-computer - Thomas Raukamp (http://www.st-computer.net/)
Thomas Raukamp, current editor in chief of the largest paper based Atari magazine left, gives us the opportunity to constantly inform all readers of

st-computer about the contest. Thus we are able to reach a far bigger number of Atarians including those without Internet access. st-computer is also generously sponsoring the contest.

TransAction (http://transaction.free.fr/)
DDP (http://www.cix.co.uk/~derryck/index.htm)
TransAction and DDP are crews of people who support the Atari Community by providing high quality translations of recent software releases. This year they also kindly help all contestants of the coding competition by freely offering their translation service to them.

Joachim Fornallaz (http://omnis.ch/jf/)
Joachim Fornallaz, the respected author of essential utilities and Milan webmaster, has kindly volunteered to create a custom GEMSetup Installation routine. The custom GSU will ship with the final LBC archive and will allow for easy and uniform installation.

Take care,
Bengy

Subscribe to news.announce.newusers for a month. Used to be standard
practice/advice when signing up to an ISP. Should still be, IMHO.
Possibly still is in some cases, but people are too busy going "ooh,
wow!" and goggling at the pretty pictures to be bothered getting a clue.

> IMO, things on the web have advanced to the point where we shouldn't
> have to worry about line length, either because the software can
handle
> it, or somehow mandatory rules are put into place to prevent the
> problem.

This is Usenet, not the web. Another thing that newbies need to learn
early, IMHO. Everyone's so busy making gee whiz statements about how
easy the net is for newbies these days that basic info gets completely
lost. And there *are* mandatory rules in place, and no I don't know the
numbers of the relevant RFCs and their revisions off hand. I'm sure they
were mentioned the last time this discussion erupted here so could be
located via Deja.

> But, keeping standards to a minimum was part of the goal of

> complaining, or else agree to mandated standards where much of the
free
> form abilities will be lost.

HTML has perfectly good standards in place (W3C) - anything else is
browser-specific crap. But this has nothing to do with Usenet which is a
plain text medium.

> I ought to be able to use HTML for
> posting, but too many people can't deal with it in this newsgroup, so
I
> use the plain text editor. But there have been times when an answer

> could much more easily have been explained with a picture rather than
> text only.

Sorry, this is just a complete misunderstanding of the situation. Usenet is a text medium, with the exception of specific binaries groups. Posting binaries in most groups (which constitutes abuse as each NG has a charter which usually forbids this) will get you a warning if someone complains to your ISP, or your Usenet access removed for repeat offences. HTML is for the web, not Usenet: HTML in news/mail is a Netscape invention from the days when they thought they could take over the net. Microsoft adopted it because they are similarly cavalier WRT standards and agreements. As they have repeatedly shown, M$ are more concerned with window dressing (apologies for the pun) than getting their software right under the hood - the same goes for their attitude to standards on the net. HTML is not compliant with Usenet standards, any more than using over-long line lengths.

> This also somewhat illustrates the problems with using an Atari on the
> net. The software and hardware just isn't keeping up. It's like
trying
> to compete with a fleet of trucks made in 2000 with a fleet of trucks
> made in 1985. You can't.

In this case there is nothing to keep up with: unwrapped lines and HTML are not compliant with Usenet standards. This hasn't changed, because it doesn't need to: Usenet works perfectly well. The problem is that the most common newsreader available (OE) comes with stupid default settings so newbies get it wrong. It is possible to configure it to get it right.

ASH Emailer has had the line length problem since it first came out. My understanding was that this was fixed with version 2 or thereabouts, but I have never used it so I can't vouch for that statement. It's either a configuration problem or (if it can't be configured) a basic problem with it being broken, in which case a workaround is obviously available as most users seem to be able to control it. Other Atari newsreaders are not broken in this respect (Okami least of all) - Emailer may be. The problem is Emailer, not the other programs.

Hi 'Odd Shanke'.

Will try just that. One other, minor but annoying point about the Milan
is its use of a PC keyboard. Nice touch but the pound sign has
disapeared and the " has shifted to the @ position. No end of keyboard
layout changing seems to change it. Just something I have to live with I
guess.

i am sorry, i goofed, it was the spring of 1985 that he fired all dealer reps that i am aware of in the u.s.a.
the reason, all dealers were supposed to educate themselves, and the public about atari products, even if you could not order them, they would get upset when you called them, and asked where can i order this stuff now that there is no rep to pass this informmation along.
finally they wised up, and started to send out mailers to us promising software, and hardware by certain dates.
with no advertising, and no corporate help, dealers were left blowing in the wind, many of my customers just would not believe that they still were in business, it was like trying to show a customer a picture of a blended in chameleon, and saying there it is.
on top of that, many software titles, and hardware just did not show up on time, or ever at all. then the rumors would fly, and atari did nothing to quell the rumors, just like milan.
thanks,
lance

>xdd's until you find out which cause the prob.

As he speaks about mintnp.prg I don't think he's using kernel 1.15.10b.
AFAIK from this kernel on renaming the kernel doesn't effect the behaviour
of the kernel anymore.
He must makes sure that mintnp.prg loads as last prog.

>>
>>
>> Can any MINT experts out there help please. This is being sent on my
>> Falcon and except for being slower and not such high end graphics, its

>
>Well, the Milan should be just as stable ;-) I know that my Hades060 is
>at least, if not more stable than my TT. But it took a while before I got
>to that point :)

But this has IMHO not to with MiNT. It's more a Hades problem. The Hades
is a damned fast machine but a pig to set up properly. Sometimes
adding a new auto prog is enough to make the Hades instable. The loading
order of the auto prg is very important on the Hades.

From: Peter_Schneider@su2.maus.de
Message-ID: <200011122037.a7049@su2.maus.de>
Source record: 54638

As far as I remember the Falcon's ROM was a special chip that was to replaced by Atari if an update was desired. TOS 4.04 should be the recent one.

You can find some information on how to do this on
http://atari.nvg.org/stacyram/ (PS/2 SIMMs only).

This is Stacy-specific, but except from the physical layout of the mobo it
works exactly the same on every ST.

> so why is it contained above

I suggest you go and rad RFCs and go back to the history of Usenet/email etc.
Know the diffrenc between a sig file and a posting. If you did have a clue
then you could very easily get your news rader to strip out th sig file
in my posting. It is a sig file using standard separators "-- " and all
good newsreaders can strip out anything below this.

I am not going to remove my sig for a few people.. those people can get
their newsreaders to do the very simple and standard config job - something
which has been in good newsreaders since year dot.

So get real!

> I have been watching this discussion with interest amazment, and finaly

> mails sent on the subject the more advertising can be done, I am of the
> opinion that it is a self generated thread in an attempt to sell internet
> services, most of which can be had for free elswhere.

I then suggest you read the thread and get to understand English. How can
you realistically say that I am using this to advertise my company's services?

If at the end of the day you do not wish to know about somthing that may
affect you in your dealings with someone, then fair enough.

It has now become very clear to me how very narrow minded some Atari users
are in this newsgroup... and the more I think about it, the more I feel glad
I got out of serving the Atari industry at an early stage.

I gracefully bow out of this thread and this newsgroup, but do request some
of you in here to think reality.

Thankyou very much for the info.

It doesn't seem to difficlut a few hours at most!!!

and if that sves me £129 on an upgrade board then all the better.

I not to worried about breaking the machine as it is intended as an
experiment anyway as I have two of these machines, an STe and a STfm.

The next experiment may be to build the IDE controller for my STe which
allready has high density internal and external disc drives (the machine is
in a PC tower case so both drives are internal) all that is missing is the
hard disc!!!

Wish me look!

and thankyou again.

I asked about upgrading a /mega ST 1to 4 mb without using an upgrade board.
I know the prices of bards ar not quite what they used to be but at ?129 t
is a little bit pricey as I can buy almost 256mb for my PC.

I also asked if there was a solution using 4mb simm's

Mark has hinted that this is the case. I would like more information about
this please.

I'm not afraid to use a soldering iron. and for your information I am a
fully qualified computer technition / electronics engineer and so comments
like:-

If you don't know how to do such a job you
probably couldn't do it even with the right
information (note: this is nothing personal).
False economy. How much is an upgrade
board these days? Not very much at all
for something that is properly designed to
do the job instead of hacking around

as quoted by Shiuming Lai are not particulary welcome as all I asked was a
simple question!!!

Is this what the Atari comunity has come to?????

Upgrading ST/F/M/FM's aren't as straight forward, and I haven't heard of
anyone upgrading to 2 or 4 meg without an upgrade board and these tend
to be more expensive than buying a secondhand upgraded machine.

There are Mega ST2 & 4's so I presume they have places for the extra
memory on the motherboard!

The STE's however are a different kettle of fish, they are dead easy. I
have heard, and tried it myself, and used 4 meg simm's instead of 1 meg
ones! they work but you can only access 1 meg from each simm.

"someone isn't screwing up the atari as bad as they are the amiga right
now"

How?

Is it simply the "we're spending $$$ to buy Amiga", six months later
"we're losing millions, let's sell Amiga" cycle they're in? (Re: Atari
to ?? to Commodore to Escom to ?? to Amiga Inc to ???)

Or is it more a poor/bad management?

(From an Atari enthusiast wondering why this Amiga discussion is in an
Atari newsgroup)

(Followups set to Atari, Amiga advocacy newsgroups)

5660. Photoline - no upgrade

Newsgroup: comp.sys.atari.st
Date: 2000-11-13 00:00:00 UTC
From: ebaiz@skyenet.net
Message-ID: <tLSP5.1636$Bi3.5159@newsfeed.slurp.net>
Source record: 54551

Hello all,

I talked with the authors of Photoline about an upgrade for the Atari version of Photoline. Of course I got the familar answer. "The Atari market is too small, blah, blah, blah". They also said that a C++ compiler is needed. I suggest Pure C, but they informed that it is only a regular C compiler and not a C++ compiler.

I then came back and ask them for a possible patch that would allow me to run Photoline under Magic. Here is what was said to me:

"Pure C is very old and does only plain C, no C++. For such a big program like PhotoLine 32 is, we need C++.
PhotoLine has no problem on MagiC. It runs without problems on MagicPC and MagicMac. I think there is a problem with Magic for Hades. Try to contact Axel Gehringer ag_comtech@t-online.de I think he tested for PhotoLine on Magic with Hades.
--Gerhard Huber [Computerinsel GmbH]
support@pl32.com - http://www.pl32.com"

This kind of reminded me of the olden days when I was writting letters to Roberta Williams of Sierra Online why no version of King's Quest for the 130XE. If anyone has any ideas or comments, give Gerhard an email.

Hi,

My Milan keyboard changed when I changed my TOS to English instead of the default German. I have a German keyboard which obviously now does not match the English layout. Other than that none of my keys changed on there own.

>
> I do have one somewhere, I'll dig it up later:)

The disk should contain the xcontrol.acc and amongst others the general.cpx
which allows you to run the mega ste, (mega ste only, not mega st) at
16mhz, cache on / off, otherwise it stays at 8mhz, cache off..

All mine do.

Not a lot of people seem to be aware of this, run cubase at 16mhz with NVDI
2.5 and see the difference.

I notice most people who want something still forget to say which continent
they are on......

I'm in the UK.

Barrie at Keychange.

You mean the keyboard tables do not match the symbols printed on a standard
(UK I assume) PC keyboard? That would be a bug.

If you send me a description with the wrong keys, I should be able to fix
that in the next TOS release.

Hi,

There is a quick way to resolve this problem: hold the Alt key
and type the ASCII code of the character you want to get.

By example, Alt + 64 will put the @.

GCC is a complete C / C++ / Java / Chill / Fortran / ObjectiveC IDE....

And it's available since many years on Atari (Mint/Magic/TOS)...

IIRC STZip 2.6 has a bug so that the root folder of an archive can not
contain more than a limited number of files (a quite low limit; about
128 or so, I think). However, there can be more files in subfolders.

I think STZip also has another nasty bug which appears when one
tries to rename files in an archive, or something like that.

Maybe you can try to use InfoZip's Unzip 5.4 to unpack those archives?
Thee's a chance that it would work. Also, Unzip's counterpart Zip 2.3
has an option for repairing corrupted archives- that may help to
save something out of those archives.

So why don't you go and buy xMB for your PC?
That's a completely stupid comparison. It's like
saying you can buy 5 PC keyboards for the price
of an Atari one. Of course you can. Does it solve
your problem?

> >I also asked if there was a solution using 4mb simm's

a
> >simple question!!!

So you got a simple answer! If you're a fully
qualified engineer of any sort then you should
know how to specify properly. Your query
was explicitly whether you could use the CHIPS

from your SIMMs, rather than using the SIMMs
themselves, so what else does that suggest except
that you're yet another time-wasting cheapskate
ST user who is so desperate that he wants to go
to the length of removing the chips from these SIMMs,
probably got for close to nothing from a car boot sale
or salvaged from scrap, and hack them onto the ST
motherboard?

> >Is this what the Atari comunity has come to?????

> Not in the least, maybe it was mean't to be a little humour or not, I

It wasn't humour, sarcasm nor a comment, it was
sincere advice, not least because I see so many people
cause themselves grief by doing things in a seriously
compromising fashion for the sake of a few pennies.
If you don't like that it's your loss.

5678. The Joys Of KCS

Newsgroup: comp.sys.atari.st
Date: 2000-11-13 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8upgov$d1q$1@nnrp1.deja.com>
Source record: 54569

Hello All:

I posted this on Atari-Midi Egrp, but perhaps you would like to see an example of what we talk about on Atari-Midi .

About the program: KCS Omega ver 4 is now available on my site,(see sig) so any of you can try this program and the file I am talking about. I guess you will need a midi sound module however.(hopefully GM compatable)

The link goes to a folder that contains the KCS ALL file as well as a Midi file that demonstrates it. Please have a listen to the midi file.

Go here for the link:

http://www.egroups.com/files/atari-midi/Midi+Files/TIMIDI/MM-KCS/

Just put this together. I have not really worked in open mode that much, and wanted to try it. So I recorded a lot of small 2 bar sequences using Music Mouse on one of my other ST's going into my falcon running KCS.. Then I would take go into EDIT, select the first track,then select TIGER from the MPE menu, then change midi channels and select a patch from the program list (GM list of instruments....this is NOT available in the KCS ver 4 version of Tiger but only in ver 5. However Tiger Cub has this))and then from the menu select TRACK TO SEQUENCE command. This converted the track to a sequence that can be viewed in OPEN MODE. Once I had a lot of sequences put together including some drum tracks (patterens)I played them from the OPEN PLAY mode.Then recorded my results right into Cubase on my TT030 and converted it to midi file, which is the Mid that is in the same folder.

It was such a joy to be able to pick , start, and stop sequences right from the Computer keyboard all at your command. I do not know of ANY sequencer on any platform that does this. What a lot of fun as well as intuitive and interactive. There are probably more tricks to this as well.

To check this file out on the KCS ver 4 (shareware) edition, just load the program. Then from FILE, select OPEN and bring in the MMOUSE.ALL file. The file loads into the TRACK MODE. What you see are 40+ tracks all filled up. These are the indevidual patterns on each track. Don't play it from here as it will be a mess.(However you could by using the solo command) However select EDIT at the bottom of the screen, and the Edit menu and event screen is presented. Then

select OPEN MODE. Then the dialog changes. Then Select OPEN PLAY, and then the Open Play screen comes up. Hit 0 on the 10 keypad part of the computer keybrd TWICE (00) and you will hear a drum patern sound. Then start selecting patterens on the qwerty keyboard. You can start a sequence by hitting it once,. then to stop it, hit the same key and it finishes to the end of the bar and stops. (Neat heh?)Start another sequence. All the sequences are in the same key. Each is mapped to a different midi channel and GM sound. A lot of FUN HEH???!!

Try creating your own from scratch...this is a different way to compose then just linearly as in a track style sequencer.

I would like any comments.

I would recomend if you haven't had any electronics experience, don't. I do this stuff for a living but it is very difficult to do it this way. The Marpet Board's are fantastic and would alway's prefer to do it that way. Particully on a MegaSTx. The marpet boards are pretty tricky if you have no knowledge of such things as it is. There are over a hundred solderjoints (depending on the exact varity of simm), using the solder method. The best places to get Doc's from is Vess's home page or if you are clever enough atari.nvg.org. The last site has the doc's for a Stacy 4mb upgrade but the same principal's apply....

Good Luck
Mark

I'm on that bloody big island between the Pacific and the Indian (never seen the indian), called Australia.:-) I have downloaded most of the stuff of the disk's but there are a few files that seem to be specific to the MegaSTE on the original disks. I always run NVDI 2.5 and 16Mhz + Cache. It is as they said in STFormat when it came out, a rich Kids game machine....

I try not to patronise people, but you never know what can happen if you don't know the senders technical limit's. Stuff like this I usually keep to comp.sys.atari.st.tech to avoid these sort of problems. Hate to see you get zapped by a PSU. I havent been fryed this Month:-) As I mentioned in your last post try atari.nvg.org. The main drama is you need to take another another address line from the MMU to get 2 or 4 MB. If you have any question's let me know directly by e-mail.

Mark...

60MHz DSP? What kind of DSP RAM does your Falcon have? Mine won't work
at all at 55MHz, most likely because of slow RAM chips.

All the Rom are used for The TOS. There are only a few KB available.
I made some patched Tos Rom for some person under Centek (no logo on
boot, boot on scsi first). But it's a little change. To put mint and/or
magic, you must intercept the decoding address to change to your
personnal rom (or flash like with CENTurbo II).

With the CENTurbo II, I put a lot patch for TOS and some feature (Fast-
ram, setup, new tsr manager,new bombs interceptor). There is no enough
free ram on the flash to put something so heavy like mint. For Magic
it's possible to put load immediatly the magic.ram instead of boot
under tos and force magic to reboot after patched it.

What kind of DSP ram? I don't know perhaps that the fact of having a bus accelerator is significant... (I have a CT2b).

I have some little problem of DSP interuption (aniplayer and other DSP softwares "freeze" sometimes my system), I should perhaps give my DSP to 55mhz or less but for the videl at 60 mhz, it's very stable (with a big cooling fan).

The DSP has it's own "high speed" RAM, I can't remember how fast it is
but on my Falcon I calculated that it could handle at most 55MHz. 55
doesn't work here, but 50 does. Perhaps you have had more luck and have
either faster or better quality RAM chips.

The DSP problem is caused by the CT2 design, and not by your 60Mz DSP
clock. All CT2-Falcons have this problem.

As for the 44.1KHz clock I would like to know what oscillator I need to
build my own. Does anybody know how the external clock is divided to
get the sample rate?

> may not be a whole lot of memory left. Under CAB, what are your
caches
> set for?
>
I've tried running the browsers both under TOS & Magic with similar
results. There's about 1Meg left after starting the CAB which rapidly
decreases after a few sites have been visited. It almost always bombs
well before memory becomes an issue though. Also, I've tried using it
with OUTSIDE, the virtual memory prog - same results.
HSMODEM caches are for 8k at the moment - up from the 4k recommended.
Still no difference though.

> I'd suggest you try to get things running without Magic to start. If
> you succeed, you'll know there is nothing physically wrong.
>
> Galen
>

I'm coming to the conclusion that it must be a h/w fault. I've even
resorted to installing N.AES & multitos and trying CAB under that to
see if it made a difference. I'm enclountering a different set of
problems here though. All the browsers almost slow to a halt once the
connection has been established.
I did discover why Wensuite wouldn't load certain pages though. When
you load both the primary & secondary IP addresses (both valid) in the
PPP settings it won't work. Use just one of them and problem solved.
A small victory..

30 pin simms with or without parity for the STE, 1mb max in each slot,
total of 4mb possible, without hacking about.

I just wonder if you ever have managed to get that thing working on your
Hades? It never worked on my Hades. I use clocky instead. A very good
utility if you ask me.

It's working like a dream, and now I've
added another 8 heat-sinks. 1 on each
of the 2 CT2 Lattice chips (get quite
hot), 1 on the graphics chip, 1 on the
sound chip, 1 on the DSP and 1 on each
of 3 DSP SRAMs.

I had this problem getting MSA files to my STFM. I ended up using a 486 box networked to the NT box to transfer files over and use MAKEDISK under pure DOS (Win 98SE shut down to DOS Mode after copying files to hard disk). It wouldn't run under 98SE DOS box either. And I only got any luck using real DSDD floppies. HD floppies with tape over the holes wouldn't work for me, even in a real 720K drive on the PC.

This probably won't help you, but this is what happened to me when I tried it :P

Correct. It came with the cables needed to assemble it, but all
the major parts I am getting locally. Medusa sold me the board as there
is no dealer anywhere near me.

Well it's next week now, and the HD, floppy, sound card, and keyboard
arrived.... however the case+PSU was backordered and won't
arrive until the 16th. I've been leaving the house often
so I don't have to sit there and stare at a computer I cannot
assemble. lol

It's generally OK on the smaller files, say 300Kb but start getting
anywhere near 1Mb it will pack them (although on the odd occasion it's
crashed doing that) but unpacking - no.

>Have you tried converting them to executable self extracting zip files,
>maybe it'll work for you.

No I hadn't but it's a goood point. As you can appreciate my main
concern at the moment is how to get these zipped files unzipped!

Try PARALINK from http://www.pil.net/~silvae/st_util.htm
Probably won't work with WIN NT, so you will need to get to a 95/98
machine or possible use VM Ware (www.vmware.com) to boot DOS under NT.

Hi David!

I tried the same trick with ZIPJR at offset $7166. It *almost* worked -
I got lower case long filenames in 2-in-1 but when I did a zip some
files reported an internal file error, though they seemed to compress
OK. When I decompressed them again and compared them with the original,
out of 49 files in Bengy's web-page one was missing altogether and 3
others were incomplete (all GIFs). I did this twice, with identical
results. When MagX was changed back to MinT, all was OK. Pity...

Regards, /Peter/

Hallo Peter!

X>So if you have problems deleting a file or folder that has an unusual
X>name, enable LFNs temporarily for the partition.
I solve that problem by saving all folders an files (beside the . and
.. 'files', of course) to a different partition, then zeroing the
original partition (by e.g. DISKUS) and finally recopying all that
saved stuff...

I believe that Steve uses the same version as I, but I hear no-one
complaining about over-long lines. I'm wondering if the "Ignore return"
setting has any bearing on his problem, it certainly doesn't help when
quoting messages IME.

No, but if you don't mind using TTPs then you can get updated versions
from Phillip Donzï¿½'s web site which might at least help unpack those
files, assuming that the damage hasn't been done already.

Use lha, zoo, zip or whichever file compressor you can get for both
platforms. Or a null modem cable between the two machines.

No. You can clock it as fast as the FPU can handle. Take a look at
http://atari.nvg.org/ (see in the hardware section) for details.

And while you're at it you should speed up the DSP to 50MHz as well.
It's very easy to do, 100% stable and reliable and there are no
compatibility problems that I'm aware of. I have had mine clocked at
50MHz for more than five years now without any problems at all.

The same applies to aICQ, you can either use falcon compatible xbios sound routines (should work with newer MagiC versions too) or direct DMA-sound. As previously mentioned you can use external players to use other sample modes than avr-samples. Either use gemjing directly (only recommended for ppl using single-tos) or send the sample path to av-server. Then av-server can decide what sample player should be used, and the advantage of using the av-server is that the sample playing will not block any other processes.

Eh?....If you've an STe then SIMM's should go straight in, if you have one of the rare ones that takes SIP's (or a Stacey) then I have some 1Mb SIP's somewhere.....If you have a Falcon or a TT then they used plug-in boards for memory and some of these use SIMM's. Some of the boards use 72-pin and some use 30-pin....If you have an STFM then you need a board that plugs into the video shifter and the MMU via ribbon cables, and it hosts the SIMM's...

Generally, these things have to be done step by step. One idea I'm having is that if you are running Magic and the browser at once, there may not be a whole lot of memory left. Under CAB, what are your caches set for?

I'd suggest you try to get things running without Magic to start. If you succeed, you'll know there is nothing physically wrong.

5746. Atari STE may still be for sale...

Newsgroup: comp.sys.atari.st
Date: 2000-11-14 00:30:18 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <uVPdDECaeIE6Ew0o@lovecraft.demon.co.uk>
Source record: 54584

Haven't heard back from the original buyer, so:

Possibly still available:
Atari STE, 4Mb, HD internal and external floppy, RSVE, switchable TOS 2.06, joystick extension lead, mouse, joystick, Replay Stereo, various programs, 80Mb HD with ICD Link2 and cable, monitor switch box.

All powered from external PC PSU, ideal for re-caseing or just convenient to power all at once (including the monitor!).

Offer was standing at ï¿½70. If you collect from the Scottish Borders, I will also include a slightly unreliable Philips/Commodore 1084 monitor at a lead which you could use to make a SCART lead (I've been using a CM8833 Mk II with the STE, but I want to keep that monitor for my 800XL).

If your FPU is rated at 25 or higher no trouble, if it is 16 be cautious.
Have a look at www.atari.nvg.org for further details

There is. Also the MagiC VFATCONF should work under MiNT too.

Btw. it doesn't matter under MiNT if you have the VFAT extension enabled
or not. The long file names are always internally handled (especially for
the delete operation). If disabled you just don't see the long names and
can't create long names.

I find when i get a new modem that it needs training, set your port speed
to whatever the modem needs, use a terminal, type ATZ, then AT&W to
store, Some modems requires their DPS to cop a sniff at what its dealing
with.

Hi Galen,
I'm curious as to why you wanted that code for BackwardIII and
was James's INF file what you were looking for?
Regarding the F16 simulator program, I've since found that if the
"All Sound Off" is selected (on the first screen that it is selectable)
then the computer does'nt lock up almost all the other features! Turning
the sound back on after taking off is OK then! There's still a lock-up
though if Esc, Help, or * is hit!!!
(running on a 'vanilla' Falcon MKI, 14 meg, TOS 4.04)

Usually, but not on the Mega STE. The internal SCSI interface can
actually be damaged if the drive is terminated, so *don't* terminate
the drive. You can find more information here:

Alright, ages ago I played with a battle robot simulator on the Atari ST. You'd place digital components like AND gates and such on a grid, then 'solder' them together. They'd then battle on a grid, attempting to shoot eachother, and some kind of food or something was randomly placed on the playfield. I can't remember if that provided ammo or what... It was a standard GEM program.

Anyone remember what it was called, and where I can find a copy? I'd really like to play with it again, and see about implementing it as a web based thing. I remember the readme saying the author was considering a windows port, did that ever happen? I've never seen anything quite like it since...

Replies via email please!

Hi Martin,

You are correct, Clocky is a good program. I have used it to correct the keyboard mapping. It also seems to have cured an instability problem with the PC keyboard, which happened with the keys in the top left hand edge, 1 in partic. Touching it would produce a non-stop string of 1's only stopped by hitting another key. Qed seemed particularly bad for this. I have now gone over to MagicMilan/Jinnee as there are just too many variables in the NAES/MINTNP set up to correct. All seems very stable, except that qed won't link back with Amail after I have typed a

mail and pressed save and quit, (I'm going over to MyMail) and DA's Layout wont run in Magic, it bombs out when I try to use its file selector.
Thanks for your help.

Bob King.

5769. Interested in ST development

Newsgroup: comp.sys.atari.st
Date: 2000-11-15 00:00:00 UTC
From: "Daniel G." <dang@elp.rr.com.NOSPAM>
Message-ID: <8FED36892daQngelprrcom@news-server>
Source record: 54456

Hello,

I am quite fascinated with (what's left of) the ST scene, and I am toying with the idea of writing some software, namely a midi sequencer/harddisk recorder. This is totally irrational in light of other software and systems out there, but I don't care. I like older technology and would like to avoid the present day stuff if possible.

However, I need to know a few things, maybe you all can help me. (Please do, if you can!)

1) I am looking at getting a Medusa Hades 060 since it has ISA ports, and I would like to continue using my Turtle Beach card, as it sounds very nice, and can be used for DSP processing. (I know I would have to write a driver for it, this is not a problem) The StarTrack looks pretty nice, but on the other hand it's very expensive. I have seen mentions of some bugs with this Hades computer; can someone please elaborate and let me know what I could encounter? I would like to use my SCSI harddrive with it, are there any problems in that department?

2) What development software exists, is there anything freeware that isn't a memory pig? (ie, trying to avoid GNU software) I would need a C compiler, preferably with an inline assembler. How hard are these to come by?

3) How much low-level and TOS programming documentation is out there on the net? I don't mind learning to code a completely new system, but doing it blind is something else altogether.

Is there anything else I should know? My experience is with freebsd/linux primarily, and I've grown quite sick of the whole environment, and would like something simpler and more direct for what I want to do. Multitasking OSes cannot cut it for midi timing, and I am craving a bit of nostalgia anyway (not that I've ever owned an atari before)

Thanks,
-dan

As long as it's a FAT32 partition you can simply delete the particular
file with the standard set of functions offered by DISKUS, like you can
do this for normal FAT partitions.

Sorry, I meant VFAT, not FAT32. And BTW, you can also zero the partition
with HDDRUTIL.

We can find someone. I would do it if, the author are willing to give us an upgrade for getting to the magic number of 500.

Also Lonny Photoline does run on the Hades 060 under regular TOS and Geneva. I cannot get it to run under Magic and N.AES.

>
> My Nemesis and Mighty Sonic have DSP problems with Aniplayer. The AB and
> Nemesis works fine....

I used to have the same problem with the DSP on my _stock_ Falcon and
MagiC. This occures with all softs using the DSP, either directly or by
the use of JPEGD.PRG. This happens only with the _first_ cold boot: I
mean not with ctrl-alt-shift-del, only when I power the Falcon up.

Then I discovered Magellan (Pub: http://magellan.2000.free.fr/), a very
nice but Falcon only program useful for radio ham. My attention was
attracted by these words in the readme file:

[begin of quote]

INSTALLATION :
ï¿½
.../...

- For MagiC users, put the program "DSPXBIOS.PRG" from
the AUTO folder of Magellan into the AUTO folder of
your hard disk.

.../...

DSPXBIOS is a program from Didier Mequignon which
replace DSP routines of MagiC which overwrite the
system one's with its own faster routines but less
reliable since there is no errors protocols handler.

DSPXBIOS fixes also a bug from MagiC which don't
initialise the FALCON DSP correctly at the first boot

and force the user to restart his machine.

[end of quote]

I put the patch (available on Didier's homepage) in the auto folder and
hurrah ! Aniplay now works like a dream with _my_ DSP :-)

Didier himself is very surprised by this behaviour.

Bye,
/Pascal/

The Milan TOS comes with keyboard tables in ROM that match the used PC keyboards - you just have to set toe correct keyboard layout using MSETUP or some other NVRAM-setter.

If they do not match, it is best to correct that bug ... however, I need a bug report to do that.

Hi Michael,

You are obviously correct, the Milan came to me with correct mapping and I am not sure what I did to get the incorrect mapping, perhaps it was when I flashed in a new TOS using MSETUP and NVRAM. Anyway, for the present, I have got correct mapping using Clocky. In some ways it is a pity that the Milan could not use MegaST or TT keyboards and have the dual advantage of correct mapping and quality. This would need an additional socket and PROM chip I assume.

Thanks very much for the help. I am impressed with the MagicMilan/Jinee combo I am now using. It all seems much faster than the NAES/MINTNP setup I (again) messed up. Overall message is 'If it aint broke, dont touch it'

Bob King.

I have been looking off and on at every card that passes my way, at work
and thrift stores. Haven't seen anything that I could put a ripple
counter on. I picked up Cubase Audio for $75.00 off Ebay, so my problem
is solved. Just have to fight with my kid for use of the clock:)

there is a difference.
the boards that use 4 - 4MB 30pin SIMMs to give 16MB ram are not
compatible
with a number of Falcon accelerators. Only the 72 pin 16MB SIMMs appear
to work.
This is only valid if you plan on accelrating your Falcon.

That's the problem! The .zip files I'm trying to unpack have 400/500
files in one folder in each so that would explain the crashing.

>I think STZip also has another nasty bug which appears when one
>tries to rename files in an archive, or something like that.

Not tried to do that

Hi Dan,
Firstly, it's really great to see an interest in developing Atari
software and while I'm not a programmer (so I can't help you in that
area) and as an Atari owner since 1987, I'd surely like not to have to
buy a PeeCee! So, what's the chances of you working on a browser that's
JAVA compatible (Javascript) and which also has access to secure log-ins?
Either way, good luck to you!
John G.

So why don't you go and buy xMB for your PC?
That's a completely stupid comparison. It's like
saying you can buy 5 PC keyboards for the price
of an Atari one. Of course you can. Does it solve
your problem?

> >I also asked if there was a solution using 4mb simm's

a
> >simple question!!!

So you got a simple answer! If you're a fully
qualified engineer of any sort then you should
know how to specify properly. Your query
was explicitly whether you could use the CHIPS

from your SIMMs, rather than using the SIMMs
themselves, so what else does that suggest except
that you're yet another time-wasting cheapskate
ST user who is so desperate that he wants to go
to the length of removing the chips from these SIMMs,
probably got for close to nothing from a car boot sale
or salvaged from scrap, and hack them onto the ST
motherboard?

> >Is this what the Atari comunity has come to?????

> Not in the least, maybe it was mean't to be a little humour or not, I

It wasn't humour, sarcasm nor a comment, it was
sincere advice, not least because I see so many people
cause themselves grief by doing things in a seriously
compromising fashion for the sake of a few pennies.
If you don't like that it's your loss.

From what I know about the Hades, the ISA slots for the most part
are not very useable. I think these slots support just enough of
the ISA spec to make an et4k video card work. The only other card
that I know of that works is a ROM card adapter, to allow a hades
to access ROM cartridges. It would be best to ask Medusa systems
about your specific card, and if it could be made to work.

> 2) What development software exists, is there anything freeware that isn't

I don't use "C" so I cannot help here. ;-)

> net? I don't mind learning to code a completely new system, but doing it
> blind is something else altogether.

There is lots of docs. In fact if that card you wish to use comes
in a PCI version, you can get PCI bios docs for the hades off the net.
The PCI slots have much more functionality.

Clarification: If you have an FDI then you
already have both 44.1 and 48KHz clocks
for playback (that's half its purpose). The
FDI modification is a patch which allows
recording into the Jam/FAD at 44.1KHz
without the need for external clock coming in
on the S/PDIF (it detects the absence of this and
then forces the FDI to use its own 44.1KHz clock
as master).

Yes, the Jam and FAD are superb products
(anyone even slightly interested in high fidelity
audio, buy one today and hear what you've
been missing) and Roger Jonsson is very
competent. No bull, just honest service and value.

I have an old 1040 ST which I use for sequencing and the thing hardly ever crashes. There are a couple of situations that will cause it to do so but they are easy to avoid most of the time. Is the Atari platform a more stable one than windows?
BTW I know virtually nothing about computers in case you havent already surmised that.

Not really. Some of the 30-pin boards also have poor grounding and cause
strange behaviour of the graphics - so I'd keep as far away from those
things as I could...
Get a 72-pin RAM board to make sure you'll never run into trouble.

This jumper is for auto configuring *terminator power*.
It is not for *auto-terminating*!
You have to terminate SCSI chain as usual.

>Should I take one of the jumpers I remove to get the SCSI ID and
>put it on JP8?

Yes, you should.

Hi Bob,

>but as Milan promised in golden days past to include an updated version of
>Photoline in their MilanII package, I assumed there was ongoing
>development.
Someone must have goofed when translating the Milan press release, the only
new program that was supposed to be included in the package was Tempus
Word Pro, the others were either going to be "light" versions or just the
original releases (Photoline 2.30).

>I read somewhere that PhotoLine was programmed by the team that gave us
>Studio and incorporated large chunks of the same code. I could never see
>the resemblence.
Cranach Studio was ahead of it's time, but suffered from a "weird" user-
interface and wasn't really usable for multitasking.
ComputerInsel probably implemented a lot of Cranachs code into Photoline.
For certain tasks I find Cranach still the better choice (vectorisation,
masking etc...)

>How are the camels?

Date: 08 Nov 00 15:50:43 +0100

Hi Iggy,

>Not to mention availability and future security. Now you can't use ICQ, and
>no-one but ASH will help you.
Rome wasn't build in a day, there's no ICQ client for IConnect yet, that's
true, but that doesn't mean it will never happen... Running an ICQ program
isn't really a problem, STiNG and IConnect can be loaded in memory together,
they don't conflict.

>>Compatibility with what?
>
>With other stacks. Some clients use overlays for different stacks, while
>Mintnet can emulate the STiK layer.
For IConnect there's IFusion on which a fairly big deal of the STiK/STiNG
clients work...

>Perhaps because this particular mailer does not suit my requirements? What
>if I like Teli and Fiffi, but like to use MyMail for mail and Newsie for
>news?
Just install IConnect and IFusion, and you'll be able to run all of the
above. Although it's beyond me why you would want to use Newsie...

>MiNTNet specific clients are often of use mostly to MiNT systems. And
>MiNTNet was AFAIK the first stack, not counting KA9Q and other
>monstrosities.
IConnect takes advantage of the "threads" in MagiC, MiNT doesn't know
threads.... Why is it allright that MinTNet clients are specificly written
to be used on MINT, but IConnect clients which are written to take advantage
of MagiC are not acceptable?

>And how does Emailer connect to the outside world? Through MiNTNet? Or will
>iConnect too run on MiNT?
IConnect up to version 1.7 runs on MiNT, same thing for Emailer 2.3

>>IConnect is not for sale, it's free, you can download it from the ASH
>>website...
>
>Great. Does it have programming documentation?
No it hasn't, for 99% of the users these are useless anyway. If someone
wants to program an IConnect client he should get in touch with either ASH,
Sven Kopacz or Jï¿½rgen Koneczny... they will be delighted to oblige.

Cheers from Belgium

Hi David,

>MiNT started with support for case-sensitive filenames and so if MiNT
>was present, it swaps into a case-sensitive mode. Since it doesn't check
>for Magic (MagX), which from at least v5.00 has the same GEMDOS, it
>stays in the standard 8+3 mode.
True, but this only applies to versions up to 3.10, from version 3.11
onwards it checks for MagiC LFN so the problem doesn't occur anymore. The
current version is 3.20, and there's a 3.20b3 released as beta...

As for STZIP 2.6, I found this to be a very unreliable packer, sometimes
pure at random intervals packed files contain CRC errors, a very good
alternative is Info-ZIP's based ZIP 2.30 and UNZIP 5.40, both are still
supported.

Download LHA 3.2x from: probably from the Belgian chapelie ftp server...
Download ZIP 2.3 from: http://philippdonze.atari-computer.de/

Cheers from Belgium

Hi Edward,

>Not a bad idea. Maybe we can get to 500 and see if they will give us an
>upgrade.
Have you any idea how small the numbers of sold software currently are? I doubt very much you'll ever reach that number. Gerhard could just as well said 400, they've decided to stop supporting Photoline way back in 1997, Photoline is now available for the PC and quiet a succes.

Photoline 2.30 works just fine under MagiC and there's no such thing like a patch for it. In 1998 someone released an "enhancement" for Photoline with the blessings of Gerhard Huber, technically speaking this could be regarded as a patch....
The enhancement adds following stuff to Photoline 2.3:
-Pics can be scrolled by means of the cursor keys
-Drag&Drop is supported with desktops that support VA_START
-Various shortcuts added
-VA_SEND is supported
-New tool-window which can hold ones most used/favourite commands.
etc...

I've no idea where you can download this small program from, but anyone wanting a copy... just mail me ;-)

Cheers from Belgium

>
>Thick mode now, what's MiNT got to do with it?

With your problem, absolutely nothing.

As for LZHSHELL being LFN aware, everything. MiNT started with support
for case-sensitive filenames and so if MiNT was present, it swaps into a
case-sensitive mode. Since it doesn't check for Magic (MagX), which from
at least v5.00 has the same GEMDOS, it stays in the standard 8+3 mode.

By changing MiNT to MagX, LZHSHELL looks for the Magic cookie, instead
of the MiNT one, and will allow case-sensitive filenames, including
LFNs, if it finds it.

> I don't use LFN as I got
>some very weird things appearing to happen but actually weren't or er..
>something like that!

I didn't have much of a problem with LFNs, except with some very old
programs or disc utilities. The only bad thing that happened was loosing
the LFNs. The first time it happened I had to rename around 200 files to
get the LFNs back. As luck would have it, or I managed to remember what
not to do, I didn't have to suffer the same thing twice.

>>In the version I have, v3.10 with a file size of 169829 bytes, the
>>offsets that require altering are:
>>
>>127774 (0x1f31e)
>>156850 (0x264b2)

>Now I'm really lost! :-))

They're just how many bytes from the start of the file you need to count
to find the "MiNT" strings. These are the two strings that need to be
changed.

Regards,
David Bolt

Well, I can't seem to get the serial ports to go faster than 19200 bps.

Yeah, took him an eternity to get the thing put together and there's still screws missing. He gave some excuse about being busy, then sick, then busy again, but I'm not buyin' it... <VBG>

I did another search and it seems I had the CPX's all along. I don't know what else was on the Language disk, but the CPX's were what I was most interested in.

BTW, I'm in the USA, to be specific, Central New York.

I have the Hayes Accura 336 configured to the factory defaults and
connected to the Modem 1 port. It works fine - as long as I don't try
to set the port speed higher than 19200. I'm trying to use STinG 1.22 and
HSModem7, and the only place I can find to change the port speed is from
within the SERIAL.CPX. If I try to set that to 38400 and use the STing
Dialer, I see the RD and SD lights flash, then the command ATZ appears on
the screen. Then it just sits there, I think waiting for the OK response,
which it probably already got, but missed.

Any ideas? While I'm finding 19200 on the Mega STE to be noticeably faster
than my old Mega ST4 at 14400, I'm shamelessly greedy and want every bps I
can get.

5813. Mega STE Internal Hard Drive

Newsgroup: comp.sys.atari.st
Date: 2000-11-15 02:46:48 UTC
From: taj16@dreamscape.com
Message-ID: <t13u8o20mkadbf@corp.supernews.com>
Source record: 54541

I wrote a few days ago about putting a hard drive into my Mega STE. Since then, I now have a Maxtor 540S drive to try out. All I have is the drive - and a plastic bubble-wrap envelope.

I went to CAB and the web and a Google search turned up a data sheet on the Maxtor 540S/SL drives. The information on that sheet, coupled with notations printed on the drive board itself, let me know that parity is disabled and I know which jumpers to remove to get SCSI unit 0.

The only problem I have is with a jumper labeled "JP8". The data sheet says the following: (quotation marks appear as they do on the sheet)

JP8 Jumped=Factory Default. "Don't remove"
Drive will auto configure terminator power.

Naturally, on the drive I have the jumper on JP8 has been removed.

Does anybody know more about this? I don't see anything on the drive or the sheet about connecting some sort of SCSI terminator, so I assume the drive circuitry is supposed to be deciding if I need termination or not. I haven't the slightest idea what removing jumper JP8 does. Should I take one of the jumpers I remove to get the SCSI ID and put it on JP8? Or should I leave well enough alone?

If they say don't remove, don't remove. Some of these jumpers are for
testing only, although your post hints that the jumper is for auto
configure terminator power. If this is the case, the only reason you'd
want to remove it is if the drive didn't work properly with it on.

Hmmm. HOW are you using STing and HSModem7? What exactly is in your
autofolder and in what order?

OK. First of all, what does your auto folder look like (in running
order)? Secondly, running under as close to stripped as possible,
(only the HSModem stuff, STing, and minimal CPXs) get STing running and
Ping www.yahoo.com or some similar big provider. Play around with
cache and modem speeds until you get it working. For example, with my
14MB stock Falcon, I had to set the serial port at 56K. 115 and 230
both provided a lack of stability. Your mileage may vary.

The only thing you need is a patch HSMODA.07.
Using this patch you can set Modem 2 port up to 230400 bps.

Its very simple, there are 3 easy steps

1: Get rid of ALL serial.CPX files from the MegaSTE/Falcon or TT

2: Install HSmodem7, read the doc's very carefully as it explains about the
various serial ports on the MegaSTE/TT/F030

3: Make sure the software supports the extra serial ports. I use Stalker,
but there is also Coma, Connect 95/97, Flash, and the rest I forget.

The reason for all this is thus, The CPX will only go upto 19,200 as it was
designed for compatibility with OLDER software. So program's like Teddyterm
etc will not go faster than 19,200. While Stalker will go (in theory) upto
250,000. The faster chip in the new Atari's is an SCC chip not the old MFP.
The serial.cpx actually now I think about it is primarily for the F030 as it
does not have an MFP as such. So on the MegaSTE ports 2 and 3 are high speed
scc and port 1 is standard STFM type MFP. O.K.

And from its docs you will see that while the CPX only displays speeds
up to 19k2, HSMODEM remaps some of he lower speeds. With HSMODEM fitted
and configured, a setting of 150 actually gives a port speed of 115,200
(see MFP_X.TXT). Works fine on my Falcon.

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To make room for new stock, Bravo Sierra Computers is holding a YearEnd
Holiday Sale. Everything is 10%-30% off! Atari Orders for $50 and up
are 10% off, Orders $100 and up are 20% off and orders $150 and up are
30% off provided the customer claims the discount in E-Mail. This Sale
covers Atari Jaguar, 8-Bit & ST. This Sale does not cover Monitors.
Customer pays Shipping. So order now while supplies last. Get your free
Atari catalogs at: www.atari.benjamin.net or E-Mail atari@benjamin.net

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Hello, my name is Benjamin Smith. I'm a Collector & Jaguar Game Player.
With all my games to play, I have no one to play Games with on my Atari
Jaguar. I live in Portland, Oregon. USA and I'm looking for Atarians to
play Jaguar Games with. You don't necessarily have to have a Jaguar.
Most any Atari will do. I'm thinking of starting Atari meetings in
Portland. Focused on Gaming but still supporting any Ataris. Call Ben
anytime at (503)256-9974 or E-Mail:

e-mail: atari@benjamin.net

If I'm unable to answer, leave a message and I'll call you back.

Not addressed to you in particular Mark, but your message made for a better quote:

>2: Install HSmodem7, read the doc's very carefully as it explains about the
>various serial ports on the MegaSTE/TT/F030

English docs are in the MISC section of my web site BTW.

>The reason for all this is thus, The CPX will only go upto 19,200 as it was
>designed for compatibility with OLDER software. So program's like Teddyterm
>etc will not go faster than 19,200. While Stalker will go (in theory) upto

Use Peter Rottengatter's serial.cpz - it's part of the STinG distribution from http://sting.atari.org Beware that ZControl has problems saving settings back to this CPX and probably others...

Some older comms software don't have a setting for speeds over 19200 - for these use HSModem's redirection of the sub-600 speeds to the higher ones.

Not true. If you double-clock the FPU you also double it's speed. The 030
is still more than fast enough to feed the FPU with data.

It's possible, but it's more likely that the drives didn't work simply
because the SCSI card's bus-drivers where overloaded. If you try a drive
without termination (and parity disabled, although you can do something
about that too (http://atari.nvg.org/)) I wouldn't be surprised if they
works.

Doesn't the spec-sheet say what happens if it's removed? Or does it just
say "don't remove"?

2 replies for the price of one:

#1:

>buy a PeeCee! So, what's the chances of you working on a browser that's
>JAVA compatible (Javascript) and which also has access to secure log-ins?
>Either way, good luck to you!

Well, to be honest, I'm not too interested in the Internet at this point. I know the Mozilla project is being ported to platforms left and right, but due to the nature of these opensource projects (they tend to use a lot of libraries from other projects, each of which is usually enormous), they consume tons of memory. The GUI lib alone is several (tens of?) megabytes. Pretty disgusting, methinks. So someone definitely needs to program one for the ST, but... who? Would be an interesting project (to make a browser fast and efficient and java/secure), but I'm not the person, sorry :)

#2:

>There is already alot of music type apps, some very good ones.
>Perhaps you'd consider coding something that platform lacks? :-)

True, true. But just because something has been done, doesn't mean it's been done right :) By that I'm not saying the existing sequencer software isn't good, I just mean that I don't feel the layout and methods of most sequencers are conducive to making music easily, at least for me. Otherwise I'd be using logic on a windows or mac machine. I prefer a more pattern-based approach, yet still with an ability to edit details, and most most importantly, parallel editing of tracks/envelopes, which is something I haven't seen addressed properly yet. (The only way this can be done with most sequencers is to open two step record windows up, and try to place them one over the other, which almost always lets you see approximately nothing, due to limited screen space)

I'm also kind of interested in OS development. Like I mentioned in the original post, I am sick of the unix world, and of course I don't particularly enjoy using win32 apps. I think the GUI paradigm went wrong somewhere. Kinda like cars... initially, before we had the modern layout of cities and urban sprawl, to own a car would have enabled you to get to where you need to go absurdly quickly, and would have been fairly safe as well, assuming no pedestrians in your way. :) Now even the freeway in the morning is pigass slow, and due to lights and general congestion, the average speed is probably around 5 miles per hour. Likewise, I feel the modern GUI only tends to get in the way, as you hunt for buttons and drag-down menus and such. I think we need to see a tighter integration of keyboard in the graphical environment (beyond simple hotkeys), and an

intelligent use of the mouse, which, though trivial to learn, is actually a rather slow and inefficient device. Not that I'm in a hurry, but I just want to be able to make electronic music without really struggling against the machine.

>are not very useable. I think these slots support just enough of
>the ISA spec to make an et4k video card work. The only other card

Yes, I will ask Medusa about this. I can't imagine not being able to use an ISA card (given a driver, of course), as long as the ISA supports port accesses and shared memory. So if the et4k is supported in software (as opposed to being used as part of a hardware emulation of ST innards), then I would imagine I would be able to do something with my card, too. But we shall see...

> I don't use "C" so I cannot help here. ;-)

What do most people write their software in? Assembler? The StarTrack software, if I remember right, used some kind of BASIC for the general UI, and assembler for the mixing routines. Is this common? The only problem I would have with that approach is when floating point gets thrown in, and also in the generation of tables for the asm programs to begin with.

>There is lots of docs. In fact if that card you wish to use comes
>in a PCI version, you can get PCI bios docs for the hades off the net.
>The PCI slots have much more functionality.

No PCI version, unfortunately. The nice thing about this card is the Motorola 56001 DSP chip on board (like in the Falcon). Right now I'm reading through the 700 page manual for that chip so I can make some new firmware for it that supports on-board timing for MIDI. That way I can have accurate timing (down to one midi clock) on a multitasking operating system. Otherwise the best resolution you can get is about 10ms on a linux/bsd box. Pretty nasty!

Also, where can I get the Compendium? (PDF on CDROM I guess?)

thanks a bunch for your responses,

advantage
> of MagiC are not acceptable?

Of course it's acceptable...

> >iConnect too run on MiNT?
> IConnect up to version 1.7 runs on MiNT, same thing for Emailer 2.3

...but your logic fails a bit here ;-) MiNTnet only works with MiNT
(*), so there has been no reason to consider MagiC- or TOS-
compatibility. With IConnect running on MiNT it would make sense to
make it's clients MiNT-compatible as well, although programmers and
companies are free to do whatever they like.

> >Great. Does it have programming documentation?
> No it hasn't, for 99% of the users these are useless anyway. If
someone
> wants to program an IConnect client he should get in touch with
either ASH,
> Sven Kopacz or J�rgen Koneczny... they will be delighted to oblige.

So do you get any information on the IConnect<->socklib interface then,
or just the socklib (which is freely available anyway)?

(*) Now there's MagiCnet as well, something MiNT(net)-programmers must
consider in the future. GEM-apps written from scratch should work

anyway (e.g. aMail and aFTP already works with MagiC and MagiCnet), but
unix-ports are a bit more difficult. MagiC still lacks some features,
these must be either emulated or the ported program must be rewritten.

I am still fascinated also which is I own a 1040STe and a Hades060. The Midi sequencer/recorder sounds nice. The only one that works on the Hades is Sweet 16. Others like KCS Omega work mainly on the Falcon/ST. If you are going to write programs for Atari computers, make sure they work on the higher end computers like the Falcon, TT, Milan and Hades. Then concentrate on getting them to work on the ST's.

>However, I need to know a few things, maybe you all can help me. (Please

>problems in that department?

Forget about the ISA ports on the Hades. They were mainly put in for the ET4000 graphics card and in order to get the card to work, all the IQ (I think that is what they are called) 1-7 were fused into one 1. This makes it hard to do anything with any ISA cards, but I am told it still is possible to get them to work. I have not heard of any problems with the StarTrack card (goes in the VME bus) and the Hades, but you are correct in that it is expensive. I would get one if the price came down. Any computer has bugs and the Hades is not exception. About the only one that is major is the fact that there exists a cache in the way the Hades handles the SCSI port. I have three SCSI devices hooked up to my Hades (CD-ROM, Scanner and a Jaz drive). I use HDDriver as my software to drive the SCSI port. The Hades has an accessary that can turn off and on various option in the Hades including the Instruction and Data caches. Using this accessary makes it possible to run more programs on the Hades. But versions over 7.0 of HDDriver causes the Hades to lock up sometimes unless you turn off the instruction Cache before you try to open any SCSI devices (Jaz, Zip drives). I mainly use 7.61 and it works great. I have 7.91 and use it also

with the Instruction Cache turned off. Still, your SCSI hard drive should work fine. Oh, the Hades has 4 PCI ports, concentrate on them.

>2) What development software exists, is there anything freeware that isn't >a memory pig? (ie, trying to avoid GNU software) I would need a C compiler, >preferably with an inline assembler. How hard are these to come by?

I am not a programmer either, but there is a C++ developement software called GCC. Check it out at: http://www.funet.fi/pub/atari/ . Go in under Programming. A number of packages are there. The GCC pack is over 1 meg and the manual pack is around 500k. There is also Pure C, but it is not as good .

>3) How much low-level and TOS programming documentation is out there on >the net? I don't mind learning to code a completely new system, but doing >it blind is something else altogether.

Not sure, but I know you can get help. Try these sites:
http://lgd.fatal-design.com/code/downloads.html
http://lgd.fatal-design.com/
http://www.geocities.com/SiliconValley/Bay/8745/

If you want a simple environment to program in then TOS is it. Another good OS is Geneva. Quite simple and very compatible with TOS programs. There is also N.AES and Magic. Both are good, but sometimes are not compatible with some TOS programs. Any more questions email me here or ebaiz@skyenet.net.

From my experience with computers you can count on this: The more complex a system is, the more chance you have for a system crash. The TOS environment is simple hence it will experience a crash MUCH less then a PC with windows.

So why does a Unix system hardly ever crash? Complex systems are not
necessarily less stable than simple systems. But it might be more work
to get them as stable.

depends i guess...

i have had a pc set up with windows NT 4, and it would run for weeks,
possibly months, if i didn't need to move it occassionally (laptop).

and my main pc (windows 98) seems to run quite successfully for about a week
or 2 and i normally only have to restart it if i'm installing some software
for it, making a change. if i use it a lot it would probably crash about
once a week. (i leave it on all the time)

whereas other peoples pcs seem to crash after 6 hours of them leaving it
on... hmmm...

PCs are odd beasties...

It seems Photoline is a program with his own will. On my Hades I can't
make Photoline running with Geneva but it runs very happily with N_AES,
Geneva/freeMiNT and plain TOS.

Dude, it all depends on what you do with your machine. If you leave your machine on all the time, it ain't doing anything or barely. And the app you probably use the most would be office and the internet, Not what i really call intensive.
If you start using a webserver, some development kit, some heavy calculation (pov, or animation or heavy filters), or d2d programs such as cubase, cakewalk etc, you WILL THEN see a big difference.

Why do you think racing cars have to change tires every x laps? when your home car you need to change them every 3 years only?
Racing car engine might make 1 race only, when home cars would last up to 20 years (130.000 km).
Compare what's comparable, when you have a webserver that has to server more than 120.000 customers, your win95 machine will not even know what to do. Memory leaks will be VERY noticable for example.

It says:

JP8 Jumped=Factory Default. "Don't remove"
Drive will auto configure terminator power.

That's it. There is a reference on the PCBA layout about two
terminating resistors RN1 and RN2, but that layout is labeled as for a
Maxtor MXT540SL and I have a MXT540S. The layout on the drive is slightly
different than on diagram. Come to look at it, the jumper chart is labeled,
"MXT540SL Jumpers." Anybody know what difference the "L" makes in the model
number?

Here is the URL of the data sheet:

>
>Galen

Galen,
I'm curious about the Falcon. Would it be faster in running my C LAB Creator sequencing software than my 1040ST? There is definitely a sluggishness about the 1040. It's as if it's being taxed by the program and with only 1 meg of memory I can imagine thats true. Dont really know though.

If I could, for a few hundred dollars, upgrade to something faster, I would. I have been using the Creator software for so long that I am very comfortable and fast with it and I don't really wanna learn a new system. I also like the way Creator is layed out (pattern based) better than what I've seen of Performer. It would be cool to hot-rod my Atari system a little.

So I guess my point is that I'd like info on what it would take to run the Creator program with a little overkill.

sadly the Falcon won't run Creator, some versions of NVDI or the old Warp9
will give faster screen redraws with an ST.
It can run on a correctly set up Mega ste and is a bit faster

Hi Edward!

When a computer needs to load a file or access it, it needs to "open"
it. When it's finnished with it, it should "close" it.

What is probably happening is that there is some program that
is installed on your Hades that has a few of it's files in open
state. They are probably staying open as they're in constant use,
like an OS, which would also explain why it's only the C drive, where
your OS is presumably kept.

Try running a clean system with only HDDriver, and whatever files the
Hades needs to boot up with. Run in single tasking TOS.

I hope that helps, cos it should.

I am looking to expand my 1 meg Atari 1040ST. I'm not keen on soldering stuff to my board, but I found out about a company named Woller and Link which is selling a Magnum-ST RAM cart (which can expand up to 16 meg). Is there a way for me to get one without having to send away to Germany? Maybe a mail order company in the states that has one? (I know I'll need MagicOS to use it, but I'll owrry bout that when it comes time to)

Hi Peter!

Yes, I have done that as well, but it takes time. In the case quoted I only copied one LFN folder to a non-LFN partition, while trying out my 'modified' (MiNT->MagX) ZIPJR to see if it would handle LFNs. As I said elsewhere, it *almost* did but complained, and lost some parts of the archive.

I imagine you mean the only one that works without a dongle fitted. I have got a card in mine which takes up to three dongles, and Cubase runs exceptionally well. There are known clashes with the Mach 64 graphics card, but it is OK with my ET4000 and is also OK with the new Ati card.

The only other problem is a conflict with the SCSI port, which I am told is down to the way Cubase was written. There are no problems with accessing the internal HD and the floppy drive.

Cubase is also best run in single TOS with as clean a system as possible.

Cheers

Paul

No - the *adapter* will also work in ST Low - it's the monitor that won't, unless it is one of the few Multisyncs that will go down to TV scan rates (~15 kHz). Some early NEC Multisyncs did (3D?). Newer versions tend to only work down to 30 kHz line rates, so would need a line doubler to work in ST Low and Medium.

Yes, it is. To be fair, it is also much simpler than Windows. I
haven't crashed my Falcon in months. This PC, on the other hand, has a
variety of "interesting" "features".

Since I have a STe, I generally don't turn on the Falcon just for
games. However, it occurred to me that computers don't live forever,
so I figured a copy of Backward III might be a good idea to keep around.

As for the .INF file, probably, but I won't know for sure until I get
it home... No manual MIMEing on this PC.

I didn't remove it. It was gone when I got the drive. I just want to know
if I should put it back, or if I should try it without. Except for this one
jumper, nothing on the data sheet addresses applying or removing
termination.

Now we may be getting somewhere. The original owner told me he tried two drives in the internal bay before sending the Mega STE. Neither worked. He said there was no guarantee that the drives were good, but he also has told me that the drive needed to be terminated. Could it be that the internal host adapter has already been disabled by his trials?

Fortunately, the external DMA port seems to be working perfectly. I can still get an external case and run the drive using The Link. However, I should at least try the drive as an internal first. That still leaves a question: Should I install the jumper or not? What is the effect on the drive of removing the jumper?

You'd be best to try ftp://chapelie.rma.ac.be for HSModem and STGuide,
English docs for HSModem from my web site (MISC section), and
http://sting.atari.org for STinG. Sting is now much easier to set up than
earlier versions, but there seems to be a bug in the dialer section which
allows you to enter lines for a log-in script if you need one.

Don't remove JP8, remove the two resistor packs RN1 and RN2, disable
parity and set the SCSI ID to 0. Then it should work.

Hey Raymond,

I've got the latest model they sold with one 64 Mb EDO chip.
It has two slots so I could add some more. Problem is finding the chips.... you can hardly find any 128 Mb SIMM these days.

According to Aixit the following types are OK or Not OK:

Size Designator OK/not OK

16 & 32Mb xx1740x OK
xx1640x not OK
xx6516x OK
xx6416x not OK
64 & 128 Mb xx6540x OK
xx6440x not OK

The not OK types are asymmetric models.

If the designator has a V somewhere in it, or Siemens types starting with HYB31 can cause problems in some TT's (these are 3.3V types)

In case you use 2 simms of different size in Mb, operate the bigger one in slot 0 and the smaller one in slot 1.

>where I can download them?

I suppose they're all on chapelie.rma.ac.be, the Belgian FTP server.

>I need more information. I'm tired of not knowing what I'm doing.

Connect your modem to Modem 2 and use scc.prg instead of mfp.prg.
Using Serial.cpx, configure the port to 115200 bps. You may also need to
configure scc.prg, at least to enlarge the buffers.

Well, with thanks to Pete (and the wonderous Amtrak, who are always quick), I woke up to a Falcon030 being delivered!

I've fitted the FPU, which took little time but I can understand how someone might crack a PCB if they didn't line it up very carefully. Don't know how to test it, but everything still works ;) The internal speaker is very silent, though, and I did reconnect it properly (wasn't working before, either, so I don't know if there's a utility disabling it as the jack socket is providing sound).

A couple of things are confusing me, as an ST user. One, I can't find out where to set the time and date, and I'm baffled as to how the Falcon is remembering it - they must have a proper clock. Two, everything seems to crash a lot. I'm running MagiC 5, with Thing 1.27. Don't really understand how the OS is working, to be honest ;)

Must happiness in the Electronic Cow software, which is loading and working, and just wondering if I should delete all the internet software since I doubt I'll ever connect the Falcon to the net.

The main thing I'm confused by is how to load and use Falcon demos. They request things like 'ST Compatability' mode, and seem very happy to completely trash the OS, not work at all (68000 exception) or mess up the screen display.

What's the best freeware/shareware sequencer to use? I've been using TigerCub on the STE, which is basic but very easy to just sit down and use.

Finally, why on earth didn't Atari make STs to the same standard! The Falcon's case feels better made, clips together slightly as well as being held by screws, and the whole system feels more substantial.

It reports TOS version 4.00, with a date somewhere in 1996. I was told this is actually TOS 4.06 (or at any rate, not the original Falcon TOS).

Richard

That is probably because Unix was well-written whereas OS's like Windows
were not. When I run Linux on the Hades, I hardly ever experience a crash...

There is a setting in a CPX to turn off the internal speaker. I'd remove it
myself though.

Again, there should be a setting for that just like in the ST. About
crashing, it's MagiC5 'nuff said... You're better off using v. 6.1 Worked
great for me.

You can do a low-level format from the
SCSI BIOS of most decent SCSI cards
(just about anything better than the sort
of thing bundled with scanners and the like).

Try GEMBENCH - just don't pay too
much attention to the results. It'll crash
on the Float Math test if the FPU isn't
working properly for whatever reason.

> The internal
> speaker is very silent, though,

Bah, chuck it in the bin, that useless
bit of tin.

> A couple of things are confusing me, as an ST user. One, I can't find
> out where to set the time and date, and I'm baffled as to how the Falcon
> is remembering it - they must have a proper clock.

The Falcon's real time clock chip has
a built-in battery. You generally set
the date and time same as the ST,
by using the Control Panel. On the
Falcon (and MSTE/TT) the standard
Atari utility is XCONTROL.

> Finally, why on earth didn't Atari make STs to the same standard! The
> Falcon's case feels better made, clips together slightly as well as

The Falcon case is practically identical to
the ST (differences being the holes for
the ports, that's all). Early STs were made
to a high standard in terms of moulding
quality and all that, but the construction
has remained essentially the same.
What do you mean "held by screws"?!
All STs I've seen certainly have screws.

Shiuming Lai

Off to get it :)

>Bah, chuck it in the bin, that useless
>bit of tin.

I only wanted it because the main output is fed through my mixer/amp for
the synths!

>The Falcon's real time clock chip has

I have that, somewhere. It'll be on the language disk.

>What do you mean "held by screws"?!

I meant the case seems to snap together at the sides, which the ST
doesn't usually, as well as the screws. But also, the internal mounting
points have those re-inforced threads, too.

Richard

Thanks. One of the pins for the parity enable jumper has been cut off, so I couldn't enable parity if I wanted to. I'll remove the SCSI ID jumper that's there (currently SCSI 2, making it SCSI 0) and put it on JP8. I've been studying the PC board for 20 minutes through a magnifying glass, and find nothing labeled RN1 or RN2, so I assume they've already been removed. Curiously, I don't find any open area labeled to receive them, either. I have been unable to find some jumpers listed on the data sheet, namely JP1(Reserved), JP2(Reserved), JP4(Write enable/protect).

Wish me luck.

From: bindon@madasafish.com
Message-ID: <t1b1hdn6odqadb@corp.supernews.com>
Source record: 54376

Hi,

I'm intending to buy a CD recorder. I've been doing some research on software, and come up with Anodynes CD Writer/Backup.

The two reviews in AC state you need Extendos 3.x. Is it possible to stick with my copy of Spin 0.34, anyone tried it?

Also is the ICD Link (date of around '92) which I have just bought, capable of working with new CD recoders? I have a feeling it was just ICD tools that was a bit dodgy.

I only have 8 partitions, each of 202 mb of size. Obviously this is not large enough to store a whole image of a CD, so is it possible to do CD to CD as I already have a IDE CDROM linked up to a TUS IDEal interface.

Can audio CD's be done in chunks, is that what sessions are?

Whats the top speed a 8mhz STe can burn a CD. Probably 1x or 2x right? I just need to find an old (ish) burner as a new 12x or 16x speed one is useless to me.

Thanks to anyone who can help me here.

Yes I agree with your observation.
I have here a box full of ATIN Falcon Memory boards (16 Mb) that take
4x4Mb SIM modules. Some SIM modules work with non-accelerated Falcons
some not.
So I sell them for cost of fabrication and the garantee: not working,
no pay...

>
> I'm intending to buy a CD recorder. I've been doing some research on
> software, and come up with Anodynes CD Writer/Backup.

Good choice - it's easy to use and its
author is very helpful and quick to do
bug fixes.

> The two reviews in AC state you need Extendos 3.x. Is it possible to
> stick with my copy of Spin 0.34, anyone tried it?

No, they use specific features of ExtenDOS
3.x - hence the free download patch for
existing ExtenDOS 3.0 users.

> Also is the ICD Link (date of around '92) which I have just bought,
> capable of working with new CD recoders? I have a feeling it was just
> ICD tools that was a bit dodgy.

That I don't know, I only tried Link 97.

> I only have 8 partitions, each of 202 mb of size. Obviously this is
> not large enough to store a whole image of a CD, so is it possible to do
> CD to CD as I already have a IDE CDROM linked up to a TUS IDEal interface.

Never tried the TUS interface, but I think
CD to CD is either possible or will be in
a future update (the first version *required*
that everything be written from an image
file). It's certainly possible on SoundPool's
CDRecorder Pro.

> Can audio CD's be done in chunks, is that what sessions are?

No, audio CDs can only be written in one.
Only (compatible, which means all modern)
CD-ROM drive can read multi-session.
It essentially allows you to record in "chunks"
until you fill the disc, then you "finalise" them
so they may be read on normal CD-ROM
drives.

> Whats the top speed a 8mhz STe can burn a CD. Probably 1x or 2x right?

2x. Be impressed. Yamaha's recommendation
for the same on a PC is a 100MHz 486 or higher.

> I just need to find an old (ish) burner as a new 12x or 16x speed one is
> useless to me.

Faster drives will come with larger write
buffers, which will actually benefit slower
machines like STs. Beware, some new
drives CAN'T write at low speed, so be
sure to check the minimum speed.
Yamaha's CRW8424, for instance, does
1x, 4x and 8x, but no 2x!

Are you sure it's not running at the correct speed? I use STinG 1.15 and
a 33.6 modem. I have the same problem in that the dialler has to be set
to 19200 or it doesn't work, however it's running at 33.6. I though it
might have had something to do with the TUS port upgrade.

My problem was that the partition I was trying it on trashed file names
and informed me that some files were as much as 500Mb about a week after I
started using it. The first thing I did (after having a quick major
panic) was to switch off LFN whereupon the window redrew and everything
returned to normal - very weird.

I currently have the following Atari 680x0 systems software up for
auction on eBay. All of these auctions end the evening of Sunday,
November 19, 2000:

Flash II v3:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=494529690

Diamond Back 3:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=494537469

NVDI 3:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=499516938

AtariWorks:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=499624974

SpeedoGDOS 5 upgrade:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=499633334

As of when I checked just prior to posting this message, the bid amount
on all items is $3, with the exception of NVDI 3, which is at $5.50.
AtariWorks has no bids. BTW, AtariWorks includes SpeedoGDOS 4 if the bid
exceeds $20.

5900. ? 'bout Falcon Ram Board/Speed of SIMMS

Newsgroup: comp.sys.atari.st
Date: 2000-11-17 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3a15fe7a$0$93852$272ea4a1@news.execpc.com>
Source record: 54389

Hello,

Thank you very much for your suggestions and tips on Falcon Ram Boards.

I have a few basic questions. Hope you don't mind, because I can't
seem to access all of DO-IT Falcon pages via Atari Launchpad.
(Not that I intend to build one)

Backtracking slightly:
I currently have 4 meg in a Falcon.
Is there room in the current board for more simms, or do I
have to change boards?

It seems that the wisest choice would be a 1 x 72 SIMM module.
question: What type? or is type variant on the
board you buy?

Ex: brand name
EDO
non composite
non parity
speed of Simms - How fast can you go?
Which is faster 80ns or 60ns?

thanks again

ken

5901. ? 'bout IDE 2.5" and Falcon power supply

If you can't find what program has opened those files, then you could try copying C: to another partition, wiping C: and coping back. That will defrag your drive. Make sure that you keep a note of any files which need to be run in the right order, if you use Kobold you can tell it to retain the original order.

Not quite 16Mb... But not far off it. This board will be quite a tight fit
inside an ST's case! (Mine is in a Tower case.)

>Maybe a mail order company in the states that has one? (I know I'll need
>MagicOS to use it, but I'll owrry bout that when it comes time to)

MagiC or TOS2.06. There's a space on the Magnum card for the ROM.

Assuming it's the same card (made by Aixit) you can find English docs and
the card's utility progs on my web site (in the MISC section).

You are referring to the graphical version, rather than the just .TTP
aren't you? ftp://chapelie.rma.ac.be/ has one that is supposedly version
3.12, and while the .TTP is version 3.12, the GEM shell is still at
3.10. So, if you are referring to the graphical version being >=3.11,
where is it available from?

>As for STZIP 2.6, I found this to be a very unreliable packer, sometimes
>pure at random intervals packed files contain CRC errors,

I never had a problem with it throwing up CRC errors, although it did
have a problem with large directories.

>Download LHA 3.2x from: probably from the Belgian chapelie ftp server...

It's not there, or it wasn't there as I was writing this. Do you know if
the author has a website and, if so, what the URL is?

My original copy of STing and HSModem7 was set up by someone else for my Mega ST4 system. I was completely inexperienced in connecting to the Internet, having only called bbs's and dialup online services before. All I had to do was change the phone number and login script. I got only those portions of HSModem that I needed to get it to work. Just the CPX's, I think. No docs. As for STing 1.22, I did get the STING.HYP file, but I don't have ST-Guide so I can't read it.

I really should get the full English versions of HSModem7, the newest STing, and ST-Guide before I try anything else. Can anyone give me URLs where I can download them?

I need more information. I'm tired of not knowing what I'm doing.

5917. stfm modulator

Newsgroup: comp.sys.atari.st
Date: 2000-11-18 00:00:00 UTC
From: Alex Taylor <alex.taylor@zeem.demon.co.uk>
Message-ID: <974545803.17836.0.nnrp-10.d4e49a43@news.demon.co.uk>
Source record: 54258

Hello

I bought a faulty STFM for £1 and need some help.

The RF modulator kept going off, i.e. screen went blank and lost sync.
Hitting the machine sometimes restored the picture. Yesterday it wouldn't so
I opened the machine and tried testing some voltages inside it modulator,
without really knowing what I was doing. So I ended up breaking the
modulator completely, along with some strange noises, a puff of smoke and a
nasty burning smell. The ST itself still works though. Now to solve this, I
could use any of the following:

1) An RGB to SCART lead. I know there's still output from this socket
because I checked it. Where can I get one of these in the UK???

2) A replacement modulator, either the part or even a complete scrap STFM.
Anyone know where I can get one of these?

3) Since I don't really know what I'm doing, a better solution than 2 would
be someone to fix it cheaply for me, bearing in mind it only cost £1 to buy.
Anyone fix ST's in the UK, preferably somewhere near Nottingham?

I hope someone can help me with this since I only started using the ST in
the last week and already I love it! Some of the games are really great and
I like GEM for it's simplicity...

Alex Taylor.

How did he do that? Are the mounting
holes in the same position? (Not difficult
to add your own, I suppose). It must have
been a Micro-ATX board, as the G4 case
only has 4 expansion card slots compared
to 7 expansion slots for most PCs.

sales@system-solutions.co.uk

They're *very* good quality custom-made
for Atari. Thick cables and tough plugs.

> 2) A replacement modulator, either the part or even a complete scrap STFM.
> Anyone know where I can get one of these?

Ditto, though if you have a display with
SCART, it's not worth it. Very bad
quality.

> 3) Since I don't really know what I'm doing, a better solution than 2
would
> be someone to fix it cheaply for me, bearing in mind it only cost £1 to
buy.

That's not how a qualified engineer will look
at it, I'm afraid. You got what you paid for
and you'll have to pay whatever it takes to
repair it. Just because you bought it cheap
doesn't mean the repair engineer will sell
his skills for less.

I've just been on the website abd it jogged my memory - Anodyne makes
Extendos, so that'll be logical.

>> Also is the ICD Link (date of around '92) which I have just bought,

>CDRecorder Pro.

As I said earlier just been on the website (which is truely excellent)
and the latest version is CD writer 2 that supposrts CD to CD, so
there is no reason why it won't work from my Atapi CDROM.

>> I just need to find an old (ish) burner as a new 12x or 16x speed one is

Right. I'll probably buy a new one actually, thinking about it, as
you don't no what state old one's are in.

>Beware, some new drives CAN'T write at low speed, so be sure to check
>the minimum speed. Yamaha's CRW8424, for instance, does 1x, 4x and 8x,
>but no 2x!

Didn't know that! Thanks for the tip.

I'm thinking Plextor or Ricoh for CDRW. Just got to ring around the shops now.

Rename MAGXBOOt.PRG to MAGXBOOT.PRX.

My machine doesn't have corrupted video on Electronic Cow programs, and
seems faster and less likely to crash! Plus, it restarts correctly.

Richard, being evil (and yes, it's version 5.X)

What sort of glue are you using Shiuming?

I take it your putting heat compound in the middle, then putting a few drops of glue in the corners.

I did this on an overclocked 386 (AMD 60 mhx DX!) but I must have been half asleep, as I smeared Evostick on it. 20 minutes later and the glue was giving of some kind of toxic fumes! Oh well, it's only a 386, who cares. :)

Hi Jo Even,

>So do you get any information on the IConnect<->socklib interface then,
>or just the socklib (which is freely available anyway)?
I suppose they will be delighted to help... after all we're not really talking about sensitive material here, it's not like the Pentagon is involved is it? the reason why the information isn't on the net lies probably in the fact that this is useless for 99.9% of the users. Suppose you would want to write some modules for Calamus SL, that information isn't "open" either, but when you would get in touch with Invers, you would find them to be very helpfull...

>(*) Now there's MagiCnet as well, something MiNT(net)-programmers must
>consider in the future. GEM-apps written from scratch should work
>anyway (e.g. aMail and aFTP already works with MagiC and MagiCnet), but
>unix-ports are a bit more difficult. MagiC still lacks some features,
>these must be either emulated or the ported program must be rewritten.
AFAIK MagiCnet isn't here (yet), you don't have to convince me of the advantages... and I suppose that I'm not really the only one that is eagerly waiting for the program to be released....

Cheers from Belgium
Dennis

Source record: 54273

From: rcollins@voicenet.com (Raymond Collins)
Date: Fri, 17 Nov 2000 02:43:48 GMT

Hi Raymond,

>I need to find out the part numbers for the chips that work to create
>128 MB and 64 MB configurations owners found are have
>working currently.

Here we go.... :-)

Suitable:
64 MBit (4Mx16)
HY 51 V 65160 FP 4K 3.3V Hyundai
HY 51 V 65164 EDO 4K 3.3V Hyundai
uPD 42 65160 FP 4K 3.3V NEC
uPD 42 65165 EDO 4K 3.3V NEC
HYB 31 65160 FP 4K 3.3V Siemens
HYB 31 65164 EDO 4K 3.3V Siemens
MT 4 LC 16M4F5 FP 4K 3.3V Micron
MT 4 LC 16M4R6 EDO 4K 3.3V Micron

64 MBit (16Mx4)
HY 51 V 65400 FP 4K 3.3V Hyundai
HY 51 V 65404 EDO 4K 3.3V Hyundai
uPD 42 65400 FP 4K 3.3V NEC
uPD 42 65405 EDO 4K 3.3V NEC
HYB 31 65400 FP 4K 3.3V Siemens
HYB 31 65405 EDO 4K 3.3V Siemens
MT 4 LC 16M4T8 FP 4K 3.3V Micron
MT 4 LC 16M4H9 EDO 4K 3.3V Micron

NOT SUITABLE avoid these !!:
64 MBit (4Mx16)
HY 51 V 64160 FP 8K 3.3V Hyundai
HY 51 V 64164 EDO 8K 3.3V Hyundai
uPD 42 64160 FP 8K 3.3V NEC
uPD 42 64165 EDO 8K 3.3V NEC
HYB 31 64160 FP 8K 3.3V Siemens
HYB 31 64164 EDO 8K 3.3V Siemens

64 MBit (16Mx4)
HY 51 V 64400 FP 8K 3.3V Hyundai
HY 51 V 64404 EDO 8K 3.3V Hyundai
uPD 42 64400 FP 8K 3.3V NEC
uPD 42 64405 EDO 8K 3.3V NEC

HYB 31 64400 FP 8K 3.3V Siemens
HYB 31 64405 EDO 8K 3.3V Siemens

In general:
64 Mb simms, ID xx6540x are OK
ID xx6440x are not OK

128Mb simms, ID xx6540x are OK
ID xx6440x are not OK

If the ID shows a V somewhere in the middle, these are 3,3 Volt ones.
Siemens IC's that have a HYB31 ident are 3,3 Volt types too.

On TT's with a CPU daughterboard, you need to jumper one switch for a
wait-cycle, see the Aixit manual/doc for the correct jumpering.

Cheers from Belgium

Maybe you can try to contact Jos Vlietstra. joolie@superweb.nl He's living somewhere near the Belgian border (Rotterdam?)

A few weeks ago he had a TT030 4+4 Mb, Crazy Dots II card for sale.

Sure you can use an ethernet card on the TT030. The only problems is where to find a Riebl network card. Another solution might be the special ROM port adapter which seems to work very good. For more info about network solutions see Karl Samyn's homepage:

> understand how the OS is working, to be honest ;)

All programs don't work with MagiC - so if a program crashes, try in normal
TOS instead...

> The main thing I'm confused by is how to load and use Falcon demos. They
> request things like 'ST Compatability' mode, and seem very happy to
> completely trash the OS, not work at all (68000 exception) or mess up
> the screen display.

Most demos require the crappy interlace video settings - and those can only
be used with a TV or an RGB monitor (not SVGA).

> Finally, why on earth didn't Atari make STs to the same standard! The
> Falcon's case feels better made, clips together slightly as well as
> being held by screws, and the whole system feels more substantial.

The case is in fact exactly the same - as is the keyboard. The only (!)
difference is the color...
It probably feels better because the case hasn't been opened too many
times... ;)

> It reports TOS version 4.00, with a date somewhere in 1996. I was told
> this is actually TOS 4.06 (or at any rate, not the original Falcon TOS).

TOS version 4.00?
Ditch it and go for 4.04 instead (which was the last version ever for the
Falcon)!
If it says 4.00, then it IS 4.00 - and not something else, regardless of
what someone might have said somewhere...
Some of the older versions have a really nasty bug: If you fill up your C:
partition on the harddisk, the FAT of the D: partition will be destroyed! I
believe this bug was with us until TOS 4.02 on the Falcon :(

Hi,
Get CDRecorder from SoundPool! It's the best software around - at least to
my knowledge. It consists of two versions - one for audio and one for data
and they can be bought separately or as a package, depending on your
dealer...
Check it out and download a demo at www.soundpool.de .
I'm probably able to sell it to you via my company if you don't have any
retailers left in Norway.
http://www.soundpool.de/writer.txt contains a compatibility list - but they
still haven't added Yamaha's CRW8424, which also works fine...

Well if anyone is interested I have an Atari PC1 IBM clone PC for sale.
This is an Atari made IBM clone stuffed in a Mega ST case with
obviously a 5 1/4" floppy. The unit has 512K RAM, photo copied manuals,
Atari labled MS-DOS, GEM, (Yes IBM GEM), Atari keyboard. Serial number
is almost a James Bond Special #0007. System has DIP switches for MDA,
CGA, and EGA video modes. I also have the PCM 124?? MDA, CGA, EGA mono
monitor in the box. Both the computer and monitor are in MINT
condition. If interested please E-mail me at fmh@netzero.net

Sent via Deja.com http://www.deja.com/
Before you buy.

It can also be said that Unix machines tend
to be used by skilled people who know what
they're doing, whereas a consumer product
like Win98 is sold to all and sundry like a
toaster gets exposed to real abuse and neglect.
People deleting DLLs, not installing things
correctly. Seen it all before.

Shiuming Lai

From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <uTI9yJAA9uF6Ew8y@lovecraft.demon.co.uk>
Source record: 54286

Once upon a time <rqBR5.3379$Sl4.13762@nntpserver.swip.net>, Claes Holmerup <newsgroups@holmerup.com> grabbed chalk and scrawled:

>All programs don't work with MagiC - so if a program crashes, try in normal
>TOS instead...

I've found out how to control the boot partition, so I'm making a TOS partition on a Syquest.

>Most demos require the crappy interlace video settings - and those can only
>be used with a TV or an RGB monitor (not SVGA).

I've noticed. I'm using SVGA ;)

>The case is in fact exactly the same - as is the keyboard. The only (!)
>difference is the color...

And the use of metal, threaded inserts for the screws, instead of self-tapping ones.

>It probably feels better because the case hasn't been opened too many
>times... ;)

That's possibly true, but I've added the FPU, and it's had a RAM expansion at some point, plus I will be adding an IDE drive soon.

>TOS version 4.00?
>Ditch it and go for 4.04 instead (which was the last version ever for the
>Falcon)!

It's 4.04. MagiC reports TOS 4.00.

Can someone explain /why/ people use MagiC? For all the benefits, it seems to be pretty buggy.

Richard

I think Lattice "C" and PureC are popular as well as assembler.
Some people like myself use GFA-Basic for simpler applications.
There is a Pascal too, PurePascal if I recall correctly.

5947. Hades060 floppy question

Newsgroup: comp.sys.atari.st
Date: 2000-11-18 00:00:00 UTC
From: Lonny Pursell <fatal@SYNTAX.ERROR>
Message-ID: <Pine.MNT.4.10.10011182040380.76-100000@TT030>
Source record: 54288

Having finally gotten the parts to assemble my Hades060 the
SONY floppy drive I ordered doesn't work. It just hangs
the system at boot time and it has no configuration jumpers
whatsoever. I swapped it out with an old floppy drive from
a spare TT and presto the Hades boots.

I assume the SONY floppy is fine, but the hades doesn't
like it for some reason.

Can anyone with Hades possbilly tell me what make and model
of floppy I might purchase? I hate to buy another and
have it not work like the SONY one.

Thanks in advance...

Clock and other settings are held in NVRAM. There are a few NVRAM setting
progs around for the fiddly stuff in there, but for simple time setting you
can use something like ZControl.

Source record: 54248

In with the Falcon was a boxed VidiST video digitiser, the colour model.
I won't be using it, since it blocks the MIDI ports and I have no use
for it anyway! (My Falcon is purely for MIDI stuff ;)).

I'll swap it for an internal Falcon HD with cable and mounting parts
(screws and posts?), preferably one which will take MagiC and Thing (or
some other alternative, but basically, big enough to hold an OS and
perhaps a couple of simple apps).

Obviously, other Falcon items are of interest too... not sure what else
I can add without hacking my machine!

(The FPU upgrade worked - GEMBench reported decent results ;)).

Hi all,

I have a Falcon030 which was working fine a few weeks ago and I turn it on just and it appears to have lost a vid sync. It appears to run though the screen has purples waves on it, screen is totally black with the RF out. Anyone got any ideas to what I can check ? would it be the VIDEL chip has died or the IC next to the RF box has died, or what ????

Please mail me direct, thanks

Chris

5959. Re: Mega STE Internal Hard Drive

Newsgroup: comp.sys.atari.st
Date: 2000-11-18 04:04:21 UTC
From: taj16@dreamscape.com
Message-ID: <t1bvu5ag0q1l9d@corp.supernews.com>
Source record: 54252

Well, it didn't work. I heard it spin up, a piercing high-pitched whine I wasn't expecting, and I thought I heard the heads shuttle in. (Can't be sure; I had the TV on.) When I booted, though, it booted from the Toadfile 44. I tried taking the cartridge out of the Toadfile and booting from an ICD floppy; no hard drive was recognized. I tried loading ICD's formatter, but the only SCSI device it would scan was the Toadfile - if the cartridge was in and spinning.

I assume the DIP switches on the internal host adapter were to set the DMA device number. All three were set ON, which should have been #7. I also tried setting them all OFF (#0) and still nothing worked. One or the other should have, since the only DMA devices I have connected are the internal adapter and the ICD ACSCSI Plus host adapter inside the Toadfile. The only reason I left the Toadfile connected was that I think the ICD software has to have an ICD host adapter connected before it will work. At least, the older versions did.

I can only conclude that the internal host adapter is bad. There are some jumpers on the motherboard in the vicinity of the host adapter. Perhaps one of them has something to do with the internal drive, but with no knowledge of their functions, I fully intend to leave them alone.

The only thing I can think of to do is get an external case w/power supply and make it into an external drive. I had wanted a nice, quiet drive I could leave on without bothering anybody with noise, but this one is far too loud for that, anyway. My Toadfile has an empty device slot, but I have been advised not to put a second drive in there because my power supply may have weakened with age and might not handle two drives any more. Seems reasonable. I wouldn't know.

I thank you all for your help, and I wish we had been successful, but there comes a time when it's better to just leave well-enough alone. This Mega STE is working fine so far, with the exception of the internal drive. I don't want to fool around inside it and knock it out. This is the only 4 meg TOS machine I have. I just spent 5 months trying to get along with a 1 meg ST, and I don't relish the idea of going through that again soon.

Hi there fellow news-groupies.
I have finally installed my CTB II on my Falcon, and it is pretty great!
However... one program I really wanted to use with an accelerated Falcon,
is Logic 2.5. This is a great sequencing program, and excellent for scoring.
I have found that the dongle for Logic, causes CTB II to crash consistently.
Even when it boots up the system won't recognize the dongle, and its
"Goodbye"
Has anyone tried to use Logic 2.5 or 2.0 on a Falcon with CTB II?
I tried it on a friends system (Falcon with CTB II) and, although it didn't
crash, it wouldn't see the dongle either.
It works fine, however, in normal Falcon mode.
Thanks, Mark

I think my Hades (bought as a Direct60) came with a Fujitsu. I don't remember if the original is still there or if it had to be changed. I don't want to open the box unless I have to.

There may well be solder pads on the Sony if there aren't jumpers. The Hades floppy should be 0, the pc's, I think, is 1. Can anyone confirm?

Any standard 1.44 Mb floopy should do if you can set the drive number.

Under Magic my TOS version is 2.00 so it seems to take the first
number only.

Why people use Magic? I use it as it's fast, pretty bug free, and
finally I can multitask.
I don't use Mint as it needs memory, speed and more hard work.

The reason why you say Magic is buggy as your running it on a Falcon.
IIRC v5 was the first release to work (well try) on a Falcon. Latest
version is, most obviously, the best to date and you'll find it'll
work a lot better than yours.

Hi Lonny,

Right then time to mod your floppy drive!

I've had quite a bit of experience getting a 1.44 to work on STs.
Firstly drives sold are set up for a PC.

They use ID number 1 which is stupid, and Ataris and a lot of other
non PCs I've seen use ID 0.

So if there is no jumpers on the back, like most new floppy drives
I've seen, there should be some little solder pads on the drives PCB.
Quite often the PCB is covered my metal, so you can't damage it, but
there are usually holes in the metal and they let you access the
solder pads. They might be marked as "1" and "0" or "DS1" and "DS0",
they both mean the same. IIRC DS means disc select.

You'll need to remove the solder bridging pad 0 and put a little
bit of solder across pad 1.

If your still having problems finding the pads, as it can be
difficult, they're usually situated near the floppy connector. Follow
the traces from pins 12 and 10. Pin 10 is DS0 and pin 12 is DS1.
Thos pins will lead you to the solder pads.

I hope that helps.

According to the Hades docs

5.: Beim Einbau eines Floppylaufwerks mï¿½ssen Sie darauf achten, daï¿½
dieses auf DS0 eingestellt ist. Fragen Sie im Zweifel Ihren Hï¿½ndler.

The floppy drive must be set to DS0.

- Floppylaufwerk
Beim Hades kann jedes PC-ï¿½bliche Floppylaufwerk (DD und HD, 3.5"
angeschlossen werden. Es werden maximal 2 Floppies verwaltet.
Da ein neuer Floppydiskcontroller eingesetzt wird (WD37065C), kï¿½nnen
Disketten nur ï¿½bers Betriebssystem formatiert werden oder mit PUMPUP
oder ECOPY 1.72. PUMPUP ist ein Shareware-Formatierprogramm von Claus Brod,
welches die gï¿½ngisten Diskettenformate bietet und automatisch immer
Betriebssystemroutinen verwendet. Sie finden es auf der Utility-Diskette.
Bei ECOPY mï¿½ssen Sie dazu ï¿½ber "Einstellungen - Floppyparameter - Zugriffe
ï¿½ber Betriessystem (BIOS)" die direkten FDC-Zugriffe deaktivieren.

One can use every pc floppydrive (DD & HD, 3.5"). One can have two
floppydrive. Because the Hades use a newer floppydisk controller
(WD37065C) it's only possible to formate disk from the OS or with Pumpup
of Ecopy 1.72.....................

ACHTUNG: der neue Floppycontroller kennt nur noch PC-kompatible
Formate. Hï¿½herformatierte TOS-Disketten und sonstige Sonder-
formate wie z.B. getrickste Bootsektoren werden von dem
neuen FDC nicht unterstï¿½tzt. Das kann dazu fï¿½hren, daï¿½ in-
kompatible Installationdisketten erst auf einem normalen
ST/TT entpackt werden mï¿½ssen, um sie dann mittels einer PC-

Warning: The new controller recognise only the pc-compatible
diskformats. Exotic diskformat aren't supported by the new FDC.........

That is strange that the Hades does not like the Sony drive. I would think
it should work just fine. You may want to try a Toshiba drive. They are
pretty reliable. I have gotten the 720k version to work in a ST, so the
1.44MB version should work in the Hades.

Just a guess, but it's probably CHK_OFLS.PRG in your AUTO folder, which
prevents access when any files are open. Try disabling it. If this still
doesn't work, disable all AUTOs, CPXs and ACCs. Try booting without any
of these and then use Optimize.

If this fails as well, copy all of C: to another partition temporarily,
zero C: with HDUTILS or similar program, then move all the files back -
or copy them and then delete the temp copy. Personally I tend to use the
tree check feature of Egale (or TREE_CHK bundled with Kobold) at each
stage just to make sure that the copies are identical.

Regards, /Peter/

Agreed but there are alternative shells available which don't have problems
with LFN, Drag&Drop, AV Server etc...
MagiC & Jinnee users should consider installing ASH Scripter, when that
program is installed packing and unpacking becomes childplay.. so to speak.

Cheers from Belgium

Hi Claes,

>Get CDRecorder from SoundPool! It's the best software around - at least to
>my knowledge. It consists of two versions - one for audio and one for data
>and they can be bought separately or as a package, depending on your
>dealer...
I've always given the same advice but lately I'm not so sure anyymore..
It's nearly two years since there's been a "real" update of CDRecorder, and
although it still is the program which sports most features it's falling
behind rapidly on compatibility.
Except for Yamaha writers it's compatibility is rather limited. Writers from
Philips aren't available with SCSI interface anymore and the new writers
from TEAC work unreliable with CDRecorder. Compatibility with popular brands
like Plextor, Sony, Ricoh etc is non-existing.

I've been playing a little with CDLAB, and although it's still limited in
features, this is the package I would recommend to anyone that sets his
first steps in the minefield. It's easy to setup, easy to handle, compatible
with almost any SCSI and IDE writer available these days and best of all
costs only 80FF (10$).

SoundPool needs to get their act together, one has to buy CDRecorder first
and then get a writer that is compatible with the package, that's the world
upside down!! I payed a small fortune for CDRecorder a couple of years ago,
now I'm forced to look elsewhere if I would want to use one of the latest
writers... another nice example of customer support.

Cheers from Belgium
Dennis

Hi Steve,

>>I'm wondering if the "Ignore return" setting has any bearing on his
>>problem, it certainly doesn't help when quoting messages IME.
>
>That is de-selected here, what you got?.
The "ignore return" button only affects the way you see the postings and
mails displayed at the screen. The green/brownish arrow has the same effect.

>Ive also got 70 Characters enabled for both options!.
Nice... but limiting the linelength to 70 or even 20 will only work if you
don't fiddle afterwards with the width of the editor-window. When widening
that window you override the settings of the linelength. In 640x480 mode the
maximum size the window can be set is 77 characters, but when you're for
example in 1024*728, it's very easy to set the editor-window to a value of
100 characters or more...
The golden rule is: once you've set the correct linelength, stay away with
your claws from the sizer-button in the editor-window :-)

Cheers from Belgium
Dennis

If they are not interested in updating PhotoLine perhaps they can
be persuaded to sell the source code, for a nominal fee, to someone
who will update it.

Better still, since it is clearly, in their eyes, obsolete why not
release the source code as freeware ?

I see that a new version of Vision has been released. It's a shame
that it still crashes on my Milan. It looks good.

You should be able to test whether the FPU is working by running Mark Baines' Profile 2 (or some other tester). Profile tests both for the presence of the FPU cookie and performs a hardware test for it.

> The internal
>speaker is very silent, though, and I did reconnect it properly (wasn't
>working before, either, so I don't know if there's a utility disabling
>it as the jack socket is providing sound).

There is an FSOUND.CPX with which the volume of the internal speaker can be varied or reduced to zero. Make sure that the volume is turned up, if this is on your system. What I am not sure about is whether this CPX only affects the internal speaker or the jack socket sound output as well...

>A couple of things are confusing me, as an ST user. One, I can't find
>out where to set the time and date, and I'm baffled as to how the Falcon
>is remembering it - they must have a proper clock.

There is an internal clock. You need another CPX - such as CLOCK.CPX, but there are others - to set it. And of course you need Atari's Control Panel or, better, COPS that is supplied with MagiC.

>Two, everything seems
>to crash a lot. I'm running MagiC 5, with Thing 1.27. Don't really
>understand how the OS is working, to be honest ;)

Should not be a problem - perhaps your NVRAM is not set up correctly (there is a CPX for that too!) That is where the Falcon stores some of its basic setups. It may also be that your MAGX.INF file is faulty. Certainly I have no problems running MagiC 5 or 6 with Thing 1.27.

>The main thing I'm confused by is how to load and use Falcon demos. They
>request things like 'ST Compatability' mode, and seem very happy to
>completely trash the OS, not work at all (68000 exception) or mess up
>the screen display.

Many demos require ST Low, unless written specially for the Falcon. Some only work with an RGB monitor, others with an SVGA. They probably also run better without MagiC, and perhaps without Thing. Use a bare machine (no AUTOs, ACCs etc.) if you can - XBoot or STOOP helps you configure

various setups that you can choose when booting. Then use the 'Set
video' menu entry to select ST Low.

>It reports TOS version 4.00, with a date somewhere in 1996. I was told
>this is actually TOS 4.06 (or at any rate, not the original Falcon TOS).

Yes, my Falcon also reports 4.00. Is this really the same as 4.06?

>If I can successfully do this, will it affect my SCSI chain by
>putting more "draw" on the power supply?

The SCSI chain does not draw any power from the power supply (apart from term power, which is usually negligible). In any case modern drives usually take less power than the older ones fitted. I put an IBM 6.4GB IDE in my Falcon to replace the orignal 80 MB with no problems. But then a previous owner did move the cooling fan from the bottom of the machine to the shielding above the power supply, which helps cooling no end!

This reminded me of my years with this software; on the 64 in it's
crudest mode with various algorhythmic with Jim Johnson stuf. Then the
C128, which I may have felt the most comfortable with. Finally, with
the St with every last incarnation of Dr. T's stuff, the scoring, the
editors, T.I.G.E.R. The whole ball of wax. I actually casually dumped
the manuals for this stuff a couple of years ago. But what an
environment. Eventually very arcane, but if you knew the system it
worked damn well.

> About the program: KCS Omega ver 4 is now available on my site,(see

5988. Need Help with PPP connecting

Newsgroup: comp.sys.atari.st
Date: 2000-11-19 00:00:00 UTC
From: Frank Lockwood <lockwood@nucleus.com>
Message-ID: <3a17bc2658d9b0@nucleus.com>
Source record: 54322

For the last few years I have been successfully connecting my TT to my ISP using a couple of telephone modems, with STing.

Starting in the spring, I began to have trouble inializing the connection with my US Robotics 56 k modem. It would dial up alright, and the modems would do their handshaking routine, and the connection would be established, but then once the "Initializing Connection" dialog appeared, nothing would happen.

At first this only happened occasionally, but it became more and more frequent, until at this point I cannot connect with my 56 k modem. When I use the 56 k modem with my Macintosh, it works just fine. I attached an older 14.4 k modem to my TT and it has worked reliably for the last couple of months, but now I am beginning to experience the same connecting failures with this modem.

I have re-installed Sting (several versions, several times), I tried STik, I've phoned my ISP and they assure me that they have made no majour changes in the last year (and of course, they have no idea what to suggest for an Atari user).

I am at my wits end. I could provide someone with copies of my DIAL.SCR and DEFAULT.CFG files, as well as the logs generated by both Sting and STik when I fail to make a connection.

Is anyone willing to help - before I can no longer connect to the internet?

Thanks to all,

Yes, perhaps they should do this. If my remembrance is still good I
believe that the source of another great graph-tool, Arabesque 2
(vector) has been released as freeware a few months ago.
>
>I see that a new version of Vision has been released. It's a shame
>that it still crashes on my Milan. It looks good.

It surely looks good. Today I received my registration key. Vision works
good on my Hades running freeMiNT/N_AES. I encounter so far a few
problems. Some gif's can't be loaded. I get this when I try to load such a
gif: This file is a non-loadable version of the given format.

Furthermore when I drag&drop an image to the Vision.prg icon whilst Vision
is already loaded the program returns me that it can't find the file. This
is a very nasty thing as Vision keeps returning that warning. To get out
of this endless loop I must kill Vision.

: I assume the SONY floppy is fine, but the hades doesn't
: like it for some reason.

It takes me the longest time to to find the jumpers on recent
disk drives. Sometimes it is a zero-ohm jumper that needs to
be moved over, and sometimes it is real jumpers, but on the
other side of the card, towards a back corner. Look at it from
the side. One jumper I found by letting another pair of eyes
look for it. It is probably there someplace, but then again.
maybe not. Good luck.

Once upon a time <8v98c6$5or$1@plutonium.compulink.co.uk>,
xlator@cix.compulink.co.uk grabbed chalk and scrawled:
>You should be able to test whether the FPU is working by running Mark
>Baines' Profile 2 (or some other tester). Profile tests both for the
>presence of the FPU cookie and performs a hardware test for it.

FPU is working. Reports a cookie of $6000, or something like that, under
GEM Bench. Goes like stink, but I was told earlier not to trust GEMBench
beyond letting it tell me the thing is there and working ;)

>There is an FSOUND.CPX with which the volume of the internal speaker can
>be varied or reduced to zero. Make sure that the volume is turned up, if
>this is on your system. What I am not sure about is whether this CPX
>only affects the internal speaker or the jack socket sound output as
>well...

FSOUND. I'll see if that is on there. I've got one CPX that allows the
sound to be set like an STE (that is, volume, left and right balance,
left and right gain), and the general controls has 'internal speaker
on/off' but no volume setting.

You understand the problem, right? I don't mind using the jack socket
99% of the time, but sometimes, especially when I'm just messing around,
I'd like to be able to hear the Falcon's noises without having a 1202
mixer, Samson amp and monitor speakers involved ;)

>There is an internal clock. You need another CPX - such as CLOCK.CPX,
>but there are others - to set it. And of course you need Atari's Control
>Panel or, better, COPS that is supplied with MagiC.

Sussed, but COPS doesn't let you set the clock. Typical ;)

Clock.APP does. It's referred to as clock.acc in the MagiC manual.

>Should not be a problem - perhaps your NVRAM is not set up correctly
>(there is a CPX for that too!) That is where the Falcon stores some of
>its basic setups. It may also be that your MAGX.INF file is faulty.
>Certainly I have no problems running MagiC 5 or 6 with Thing 1.27.

I'll check it out. I guess it's like a Mac's PRAM.

>Many demos require ST Low, unless written specially for the Falcon. Some
>only work with an RGB monitor, others with an SVGA. They probably also
>run better without MagiC, and perhaps without Thing. Use a bare machine
>(no AUTOs, ACCs etc.) if you can - XBoot or STOop helps you configure
>various setups that you can choose when booting. Then use the 'Set
>video' menu entry to select ST Low.

A lot of stuff doesn't like my SVGA display, but c'est la vie. I can
live without, I've solved a few of the bugs by setting the machine to
run certain apps in single tasking mode, like Musicom and the processor-
intensive Electronic Cow softsynths.

>Yes, my Falcon also reports 4.00. Is this really the same as 4.06?

4.06 doesn't exist. My bad. It's 4.04 in mine ;)

Richard, off to find SToop/Xboot, clock.cpx and fsound.

Jim,

I'm not sure of what IE 5.5 recommended, but a couple of possibilities spring to mind...

First, try changing the upper case letters in the url to lower case. The 'net is SUPPOSED to treat domain names the same regardless of the case, but who knows.

Second, it may just be that your ISP just doesn't know where to find the site for some reason.
Again, not likely, but possible.

You could also try dumping your cache and see if that helps.

You'd BETTER get it straightened out in the next couple of weeks, because I've heard that there's an interesting review coming thru the pipeline, slated for inclusion in A-ONE two weeks from now. <grin>

Good luck,

Hi Dennis,

DV>I payed a small fortune for CDRecorder a couple of years ago,
so did I in February 2000.

Instead of buying a 6X Yamaha that hadn't posed any problems, I bought a 8X Yamaha (8424). Result: My CD Recorder 2.x did not work with my 8X writer (reading yes, writing no). I called SoundPool on the phone monday evening by 8.30 p.m., was asked to send in the original disks together with 100 DM (~ 40 $ US) (50 DM per versions data/audio) which I did the following morning (Tuesday). Wednesday I got email that my letter had arrived at the company and that is had been answered the same day.

Thursday I made my first backup on CDR with CD Recorder 3.1...

DV>one has to buy CDRecorder first and then get a writer that is
DV>compatible with the package,
So had I done too, I had looked on the compatibility list and had supposed that the difference between 6X and 8X wouldn't make any trouble.

DV>now I'm forced to look elsewhere if I would want to use one of the
DV>latest writers...
Yes, you are forced to ask them first, and the answer will be (if you get one): Buy a Yamaha!

6014. Atari 8-bit 5 1/4 Disk Conversions Needed

Newsgroup: comp.sys.atari.st
Date: 2000-11-20 00:00:00 UTC
From: roughley@vanc.igs.net.invalid
Message-ID: <1ekdfe7.1exmavp5u1g82N%roughley@vanc.igs.net.invalid>
Source record: 54203
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I received an e-mail from someone who is desperate to have old Atari 5 1/4 disks converted. If anyone can help please contact the person listed below.

I used to have an Atari word processor (dates back to 80s). I don't remember the model (it used to run on DOS). I have quite a few 5 1/4 floppy disks with a lot of text that I am unable to extract.

I went to many places and tried unsuccessfully to have the disks converted to 3 1/2 IBM floppies.

Can you PLEASE help? I am really desparate as I need to get that info from the the disks badly.

Is there a person or place in the San Francisco Bay Area (where I live) where I can have them converted?

please contact: cuulmann@hotmail.com

Odd decision...

> AFAIK MagiCnet isn't here (yet), you don't have to convince me of the
> advantages... and I suppose that I'm not really the only one that is
> eagerly waiting for the program to be released....

I have tested a beta (very briefly) on my TT, and it seems to work very
fine indeed. It's certainly a lot faster than STiNG, which tends to
slow down the TT almost to a halt when transfering lots of data
at "high" speeds. With MagiCnet (and MiNTnet) there's no noticable
slowdown at all. I've only tested it with the Genius ethernet adapter
(i.e. no dial-up, slip, ppp, plip or anything else) though. I don't
know when the author plans to release it.

6018. Re: WTB: Original ST Games

Newsgroup: comp.sys.atari.st
Date: 2000-11-20 00:00:00 UTC
From: fmh@netzero.net
Message-ID: <8vb3ul$42m$1@nnrp1.deja.com>
Source record: 54207

I have a bunch more and some Falcon specific games but here's what I
have listed so far.

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
440-286-2567 evenings EST. I am also open to trade offers.
E-mail me your list to fmh@netzero.net

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Milan040 68040-25mhz CPU, 32 Meg RAM, 4.3 Gig IDE Hard Drive
S3 Trio V64 PCI graphics card with 2 Meg VRAM, German Keyboard
Mouse, 10/100 PCI Ethernet Card
Cased in a US Mini Tower AT case with 110/220 switchable Power Supply
Comes with all manuals, CD-ROM, and Floppies.
Bundled software consists of: Texel Home (Spreadsheet)
Draconis (Internet Suite, Browser, E-mail, Telenet)
Papyrus Home (Word Processor) and more.
Operating System(s) are TOS 4.08 (English) and MINT / N.AES (German).
Hard Drive contains a clean install so there is no clutter.
For more info on this beast goto the following URL:
http://www.milan-computer.de/gb/products/milan01.html
$1,000.00

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows

3.1
Switch back and forth between TOS and DOS modes $90.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 as a stand alone fax machine.
Comes with special fax modem, diskettes, and manual. $30.00

R/C Aerochopper by Ambrosia Microcomputer Products.
This is a R/C Airplane and Helicopter Simulator for the ST.
A Futaba 2 channel controller that plugs into the ST's cartridge
port. With the 2 channel controller it's very realistic. $50.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go.
$1.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $6.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,

docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk.
$5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk, box, and docs.
$5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Their Finest Hour (The Battle of Britian) by Lucasfilm Games.
A great flight combat game. This game is brand new and shrink
wrapped still.
$15.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box.
$5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs.
$5.00

MISC SOFTWARE

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual.
$3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

WARP 9 by Codehead Technologies. This is the famous screen
Accelerator for ST, STe, TT, and Falcon and this is the latest
version 3.80. Also included is the Extendo-O-Pak which includes
screen savers like the infamous flying toilets. Comes on 720K floppies
with manual.
$5.00

Space Racer by Loriciels. Kind of like Wipeout for the Playstation.
Comes with disk, box, and docs.
$5.00

BOOKS $5.00 each unless noted

Papa's Grafik Guide to AtariWorks Word Processor.
The ultimate AtariWorks Wordprocessing book.
$5.00
Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual.
$1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

WANTED

MagiC Milan Ver 6.1X
MagiC Mac Ver 6.XX
CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

I donï¿½t think that they will sell the source code, because in this
source code are routines that are used in the Photoline PC/Mac-versions.

Bye

As long as the writer doesn't do parity checking (old Links don't
support parity) and doesn't expect the ST to have a SCSI ID of its own
(only the LINK96/97 supports this) it shold work.

> Whats the top speed a 8mhz STe can burn a CD. Probably 1x or 2x right?

Yes, more is most likely impossible.

> I just need to find an old (ish) burner as a new 12x or 16x speed one is
> useless to me.

I think that they can be reduced in speed by software, in order to only
use 2x speed when burning.

I'd choose Plextor over Ricoh (or most other
brands) any day. My personal experience
of drive reliability and overall performance is
as follows:

Excellent (and in order of typical tray eject speed, fastest first)
Teac (whoosh!), Sony, Yamaha, Plextor (yawn)

A lot of problems
Philips (I've seen loads of Philips drives
have endless problems and wearing out
prematurely).

Haven't had extensive experience of
any other drives.

Hmm, you lost me there. The Falcon's TOS
ROM (EPROM or not) is a PLCC package
which, yes, is a square chip that needs a
special tool to get it out. I found one of the
best is those long and sharp metal things
that dentists use to pick your teeth (of course,
make sure it's clean before using it inside
your Falcon - you might give it an infection...)

Two types I've seen are Alliance and Motorola.
I've got the latter, and recently stuck a heat-sink
on the DSP, which already runs perfectly stable
at 50MHz. I might try 60MHz (some guys manage
this without a heat-sink) or even higher when I
have time.

Hi Derryck,

Photoline doesn't have any problem on
CT2 and/or MagiC 6 on a Falcon.

I'm very sure once you hear the Falcon's
internal speaker you'll want to get rid of
it again immediately. What do you actually
need it for? Perhaps the speaker itself
is damaged - try it on something else.

Posting to sdnet.computing & .general & comp.sys.atari.st.

I have quite a bit of Atari ST hardware - 3 1040 STfm - 2 Mega 4 ST - 1 in tower with accelerator [all working, as I recall] - several [6?] dead sm124 monitors [2 with a capacitor fix] and assorted mice, and some software, no games. The dead monitors were the main reason I quit using the hardware back then.

I'm looking for an enthusiast in the San Diego, CA, USA area who might be interested in giving some of this a home.

I don't normally follow these groups - but I'll drop in here periodically for the next 2 weeks. I've tried to visit some of the web sites and their links I've found from digging posts here [csas] - but so far it seems that San Diego & Atari ST don't jibe.

I remember encountering a local fellow online in the past who had a TT & Falcon, but don't remember who it was.

Sorry. I made a little mistake yesterday. I said it was freeware but the
truth is that the original programmer is willing to give away the source
to anyone who wants to take the development over. I don't know however
under what conditions, my German isn't that good and if someone has taken
over the development yet.

One can see the original message in the ATOS from 3/00.

ftp://chapelie.rma.ac.be/disk_magazine/atos/atos003f.zip (color hyp)
ftp://chapelie.rma.ac.be/disk_magazine/atos/atos003h.zip (HTML)
ftp://chapelie.rma.ac.be/disk_magazine/atos/atos003m.zip (monochrome hyp)

If you want to read it online you can find it on http://www.atos-magazin.de/

Be aware though that everything is in German.

Yes, I have tried to contact the author, and got no response. I do not
know any language but English, but am trying, and that might be the
reason.

It would be useful to know how anyone outside continental Europe got
a copy of that program recently. The firm said to be selling it did
not respond, or ship. Who, if you know, is selling it.

If all else fails, I could try e-mail to J.Tochtenhagen@ndh.net
again. That is the address I tried last time. It was 99 DM,
with an English version available.

Any suggestions?

I wrote once to Jï¿½rg, I believe in 1999 to ask for an update. You see
the version I was using that time didn't work very good with N_AES.
A few days later I got an update which worked a little bit better with
N_AES for free.

Keep trying. You never know.

If you have an STE with SIMMS you can easily upgrade to 4Megs. Its just am
matter of plugging in a pair
of old fashioned 30 Pin, 1Meg SIMMS (I Think most types work), You should be
able to obtain a pair for the
cost of the postage.

Then you could use a RAMDISK to make a RAM DISK big enough to hold the
files.

Hello!

I would like to get rid of all that noice when
dialling with Sting, but I do not know where to put in
that "atm0".
When using Iconnetct I just use one extra line with
"atm0" after "atz" in the script, and just get that
good feeling of absoltely silence!
But writing the same after "atz" in Sting will not
work.
Perhaps I have to use a spesial sign after "atz" to
show that a new command is coming?

Thank you for any help!

Well - version 3.20 did come a couple of months ago, even though there
weren't too many changes compared to the previous one...
It really is a shame you can't use all writers (but at least, you can get
the compatibility list from SoundPool's website and check it before you go
shopping for a writer) - but I believe it's the only burning program which
handles audio CD's correctly, with possibility to write indexes, individual
pauses between tracks, pre-emphasis etc. It always burns audio as
disk-at-once, which is required if you're going to make mass-duplication at
a CD-pressing plant (if you use other than disk-at-once and a fully
compatible 'red book' burned CD, they have to make a new master on tape
before making the glass master)...

> I've been playing a little with CDLAB, and although it's still limited in

Does it handle audio burning correctly? Very many Falcon users are
musicians, so that's probably the main issue...

Thanks to all for responding, especially Lyndon Amsdon as he
was correct in that the drive was set as ds1. I removed the
bottom cover and did the mod. JI Logon was correct about
the mod itself, it had solder across s1 which I removed and
placed on s0. Thanks again, it now boots with the new SONY
floppy driver!

PS. It's good a thing I work with electronics 40 hours a week,
and soldering such small pads doesn't bother me. ;-)

You guys did so good with the floppy problem I was wondering
if you would like to take a crack at this one. ;-)

The AT case has a green LED power indicator. Coming off
one of the PSU branches is small 2 pin connector which
I assume is the +5v usually used to power those stupid
"Mhz" displays you see on some cases. My case does not
have this silly display.

My question is what would it take to get this green LED
to light when I hit the power switch? Assuming I use
this +5V as the power source.

6049. Everything for $25ea. Atari Sale! Includes Atari 1040ST, Atari Color & Mono Monitors, lots more!!

Newsgroup: comp.sys.atari.st
Date: 2000-11-20 00:00:00 UTC
From: Thomas Ferreira <amishman@pacbell.net>
Message-ID: <B63F28E3.290E%amishman@pacbell.net>
Source record: 54238

That is right, $25 each plus freight for anything on this list. Or, $100 plus freight buys it all. I will just crab anything Atari and send it your way. My folks have a lot of Atari stuff so I will just take what they have and it is yours for $100 plus freight. I need to know before Thanksgiving as I am heading down to my folks and will bring home and ship anywhere in the USA as long as there is interested buyers. Otherwise, I will have them dump it. All in working order and look good.

Atari 1040ST $25
Atari SC1224 Color Monitor $25
Atari SM124 Mono Monitor $25
Atari SH204 Hard Drive $25
Atari SF Floppy drive $25

Monitor Switch Box that allows both Atari monitors to connect to the 1040ST is free if both monitors are purchased. Otherwise it is $15 plus postage.

Lots of other software, joysticks, cables, etc... are free with the $100 package. Too much to list here.

Let me know.

Tom

Very nice heavy duty case holds two 5.25" drives. Lighted power button on front, SCSI port on back. Once housed a 44MB Syquest drive. Includes the case with the internal power supply & power cord. Does not include Link adapter so if you plan on connecting to an Atari, you need one of those also. $25 or best offer.

Hi Maurizio,

Just to make sure you know... Logic Audio only goes up to vs.
2.01. That version is available on the web, but you you need to
already have the LOG3 dongle, and some other files, which it
sounds like you do. Logic (NON audio) does go up to vs. 2.5. I
ordered that direct from Emagic, but I think they don't deal with
Atari at all anymore.

Logic Audio - vs. 2.01 has a few improvenets over 2.00
Logic - vs. 2.5 has a lot of improvements over 2.0

Let me know if I can be of any help,

Clayton Murray

H>Get CDRecorder from SoundPool! It's the best software around - at least
H>to my knowledge.

You are wrong. CD recorder is too old to be good (no long filenames
supported, no SCSI-Driver support etc.).

Go and get Anodyne's CD Writer Plus. It's worth the money and support from
the developer is always the best.

And btw, it supports long filenames (both Windows Joliet and Unix Rockridge
Extensions) and SCSI-Driver.

Tschuess,

Frank

6063. Aargh! Damned speaker! (Falcon)

Newsgroup: comp.sys.atari.st
Date: 2000-11-20 02:58:05 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <fkUB$KA9MJG6Ewx6@lovecraft.demon.co.uk>
Source record: 54198

I've tried FSOUND, various other utils. There's nothing wrong with the sound coming out of the Falcon, but there is nothing coming out of the internal speaker even when it's enabled. I've reset the NVRAM, reset the sound bus (which I assume is done when the machine is powered down anyway), nothing.

I had another look inside, the speaker is connected correctly. The only thing I can see which might have the remotest connection to it is a small variable resistor type thing marked L31 (I think), beside a small chip and under the 2.5" HD area.

I'm not touching it. I've searched online and can't find anything relating to it beyond the glut of utilities for disabling it. (None of which are installed).

So, I'm off to close up the machine again until I'm installing an IDE drive. If anyone can shed any light on possible causes for my machines continued silence, I'll deal with it then ;)

Richard

I had the same problem with STinG 1.22 (Dialer 1.16) when I started
connecting to the Internet a little under a year ago with my TOS 2.06 Mega
ST4 and AT&T Dataport 14.4 modem. STinG 1.22 is the only version I've
used, so I can't guarantee my solution will work for you, but here goes:

Call up the dialer and hit the 'configuration' button. Move to the
'Addressing' screen and remove the x from the box labeled, "Request Name
Servers from Remote." SAVE this configuration.

That's all I did, and it hasn't failed to initialize a connection since.
Don't ask why I tried that, because I don't really know. (I didn't have
ST-Guide, so I couldn't read the docs. I was fumbling around blind) It
seemed to me that the dialer was waiting for something it either wasn't
going to get, or already had and missed. I eliminated the only thing I
could find that it might be waiting for.

What can I say - it worked...

"chris swinson" <exxos@bigfoot.com> wrote:

> what was the actual differance between the 2 machines appart from one
being
> in a black case :P

Hi,
The actual motherboard was originally from the stock that Atari let them take over from the start - and later on, they made new ones from exactly the same plans, so technically there's no difference at all!
C-lab did however make the CPU-clock modification that's described on my website (I believe it was number two they choose), so there was not such a big risk for problems with CAF - but some machines had to be re-modified with another modification to work properly anyway... :(
I don't really remember if they made the audio modifications that are described in the CAF manual or if they only removed the ridiculous bass-boost. Anyway, those modifications are also found on my website.
They also made a MKII, which contained an internal 2.5" SCSI-drive that was connected where the internal SCSI-terminators are located in "normal" Falcons. The sad part about the 2.5"-drives is that they were terribly slow compared to external 3.5"-drives - but it was really neat to have it all in one case ;) With some effort, it was also possible to place an internal IDE-drive beside the SCSI-drive inside the case ;)
Later on, they made the MKX, which is a really nicely designed black desktop case (no, not a rack case - in spite of how it looks...), but still with exactly the same motherboard... They removed the connectors for the audio in the MKX and placed them parted from the motherboard - and placed a connector in the case for using a Mega keyboard, but otherwise it's the same.

As you can see, they didn't make any revolutionary development, but only continued selling the same machine in somewhat different configurations.

There might indeed be, but all I was given was a drawing of the board
layout and some german text. It does not seem to be explained
if there is such a connector.

I was wondering what that connector was. Ed seems to think
his CPU cooling fan is connect there. However his view is
obstructed by the case or some drives so he is not 100% sure on
that.

From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <TMbCFdEAFwG6EwCZ@lovecraft.demon.co.uk>
Source record: 54099

Once upon a time <1ekglje.wxhdjs1qt5vr4N%northstar2010@yahoo.no>,
Hallvard Tangeraas <northstar2010@yahoo.no> grabbed chalk and scrawled:

>You can download "Explorer32" for free by going to my Notator website
>(URL in my signature)!
>It used to be a commercial program, but is now made into shareware by
>the author, who has given me permission to upload it.

I've got it - that's why I'd emailed him to ask about compatability.

>I have no idea if this works on the Falcon either, but in case you come
>across an Atari version of Sounddiver which you're not buying (or get
>several offers), I'm very interested as I need a universal
>editor/librarian for my ST.

No offers yet, but we'll see ;) I just want something that edits Roland
D-50 sounds and costs less than a dedicated programmer. I haven't even
looked into what I'm going to use in place of TigerCub on the STE...

>As for the Falcon compatibility problem -you might want to look into
>getting a regular ST/STe/Mega for MIDI use instead of abandoning
>software (or getting special, expensive versions). That might be a lot
>cheaper and simpler.

Possibly, but I just sold my STE to get the Falcon. I liked the STE
/but/... most software griped about the Medium Res screen, I didn't want
to recase (the new owner does) and I had an interesting kludge involving
a PC power supply after my ST one failed, and I got sick of Falcon-
friendly apps bombing out. I figured that as the C-Lab Falcon existed,
there has to be good MIDI software that will work on it!

>But for all I know you might be using your Falcon for harddisk recording
>and would naturally like to have everything work on that one machine.

Nope, just for MIDI. I upgraded for the reasons above (and wanted a
Falcon).

sighs If I have to spend more, I might as well get a Mac or PC and be
done with it. I'm dealing with stupid little bugs, like: Trying
MIDIQuest's demo, bombs. So set Thing to run it single task /and/ unload
Thing, and set the screen mode to ST-High (I have an SVGA display).

It crashes. And more annoyingly, Thing has messed up the file for
640x480x256, for some inexplicable reason. They tell me it won't run
under MagiC, so fine, I try all the methods I've been told for disabling
MagiC - both shift keys (in manual), doesn't work. Hold down a drive
letter to boot from that drive. Doesn't work.

I know my machine is good, and I'm happy with it, but for crying out loud, don't the programmers actually /use/ these machines? I've RTFMd. I've tried everything imaginable. Atari's main market was music, I didn't want a machine for anything but music, so Papyrus et al are irrelevant, even though they do work.

I know the programmers are probably reading this. I know that for every utility I've tried, a dozen more exist that do work. I know that I don't have a manual for MagiC 5, and it's probably different to 4. I am /happy/ to pay for a utility that does what GENEdit, MIDIQuest, Explorer32 have all claimed to be able to do - edit/library Roland sounds, specifically D-50 and D-110. All I ask is that it loads cleanly, runs, and doesn't crash.

Electronic Cow managed to make software that runs on everything - the main reason I went for the Falcon was because I couldn't use their stuff on an ST without getting a mono monitor, and I wanted the nicer look and feel of the 256 colour Falcon displays. It even runs under MagiC/Thing with only minor problems. Musicom is great, though it has to single-task it also does what it should.

No doubt some more Atari-technical person will have a reason, and say I'm crazy for asking such things. I see no reason why I am. I'm not a programmer. If I was I'd have re-written something so it would work, even in a kludged manner.

</rant>

No doubt after all this, I'll go downstairs, reboot holding down G for the Syquest that I've just copied a basic system onto, and it will all work.

Apart from one horrible moment, where I realised I deleted the GEMSYS directory from C: instead of G:, it /did/ work.

Boot from Syquest, which I've copied my boot drive onto and deleted everything but a couple of Auto programs (HD Driver, Extendos), change to ST-High, and MIDIQuest works.

And despite the slightly Amiga-ish feel to the menus *shudder* it works, and I'm sure if I hooked up my D110 (which is rather dead in terms of output - hence not in the list below) it would communicate, as DTonator did on my STE. No doubt, it would even work with my D-50 if the demo included D-50 editor files.

Now to make another Syquest for games ;)

Richard, slightly calmer now. But the internal speaker still doesn't work, and Pete emailed me to say he hasn't done anything apart from use the control panel. I shall have to live without it ;)

Hi Ken,

I seem to recall when I first got my Falcon, I also got Logic Audio. It booted up in 4 megs, but didn't work well (or at all?) when trying to record. Going to 14 megs made all the difference. It might depend on how many accessories you have going, etc. Best to strip it down as much as possible. I normally use Warp 9, but not when running Logic. I think they don't get along too well.

Hope that helps,

Clayton Murray

There are really only two methods to move A8 to any other:
Use a PC util called MYUtil or A82PC to copy the files(MYDOS Dbl dens only).

or, the best way is to use a real A8 and null modem the files to the other
computer. This at least works for almost any file/any A8 DOS.

A8 emulators won't work well as they store the disk as an image.

Hi,

>Teac CD-R50S/CD-R55S and JVC/Traxdata compatible models,
>Any writer which supports the SCSI-3 multimedia commands ;
Using a Teac 55S with firmware smaller then 1.01 or bigger then 1.06 with the SoundPool package is guaranteed to give problems... one can go to the Teac website and download the latest firmware, but there's no way to load an older version of the firmware... unless SoundPool fixes the bug, this model should be avoided...

I've no idea how the later models 56S and 58S behave, but I suppose they are based on the same firmware...

Cheers from Belgium
Dennis

Assuming that this 5V feed is on all the time that the mains switch is
on, then (if the LED doesn't already have one fitted), just a serially
connected 330R resistor, say 1/8th Watt.

FWIW it's recommended to start screws off by _unscrewing_ them first -
you can feel when the screw and hole threads meet. Then you don't risk
the screw trying to cut a new thread, ruining the old.

Chris Crosskeys of ASP used to advertise metal inserts for the pillars,
inserted into the plastic with the aid of a hot soldering iron. Probably
Maplin or similar store would have something useful too.

I work on the logic 2.5 and 2.0 compatibility last year for german
musician, and finaly, we patch it to run without the dongle: it's a pb
of speed access to the cardrige port.

A minor bug was correct on my ct2 logic to access correctly to the
cardrige port (some key doesn't work). Perhaps, now, the dongle will
run.
But, did you use only the dongle or the extended protection will midi
connectors?

My Falcon's FPU was supplied by Best Electronics, who are online
somewhere (I'm going by the bag it was in, I didn't order it). It's a
Motorola 68882, and I think they supply the 16MHz version unless you ask
for a faster one (Apparently, useful for speeding up your machine).

Did you get Chris' machine?

Richard

Seeing as plenty of us in this country seem to have Falcon's with 3.5"
drives fitted internally I can't imagine that any 2.5" drive would
cause you prblems with your PSU unless there was something wrong with
it....I have a 4.3Gb 3.5" drive in my Studio Falcon and it's been
running fine for a couple of years now....

Got an email back from the author of C-Lab explorer32, basically saying it was never tested on Falcon and evidently, as he's still involved with EMagic, trying to sell me Sound Diver 3.0 for PC/Mac *shudder*.

However, this Sound Diver program was also released for Atari - and presumably, as he mentioned it, it works on the Falcon. Anyone got it for sale still? It's either that, or buy MIDIQuest even though I'm not 100% sure it will work either :(

Richard

Source record: 54170

Hi Folks...

I'm trying to get CUbase v3 on my TT to work with a Galaxy 8Mb graphics card....I'm having the same problem I had with it on my old COCO in that most of the interface opens up and then it stops....gonna fiddle with the FASTLOAD flags tonight, but I've messed around with the compatibilities bit of NVDI (it uses v4 for a driver) and the TTRAM flags to no avail....so I wont to try other versions of v3...I've got v3.01.....are there any others that run on a TT?....I've got a legit version so I don't want cracked copies, I need the real executables that work with a dongle.....

BTW....Galaxy resolutions are really cool and you guys will be blown away when it gets released :-))

BTW2...major thanks to whoever it was suggested that my Catch Computers board would set its memory in a series of acceptable sizes counted in binary on the piano switch....after a few minutes setting and testing it is now seeing the 32Mb properly....does anyone know if this board (or these types of board in general) will take 16Mb 30-pin SIMM's?

Send him information about APE and an sio2pc cable.
http://www.nacs.net/~classics/
With a cable and a PC and the APE software you can connect your atari
and atari disk drive to your PC and transfer files to it. Some people
still sell stock 1050 drives for 20 - 25 bucks.

Another option is to get a hold of an OLD PC with a 360k floppy drive.
The older the better. But I forget the name of the program that can
read them. Anidisk or something like that.

I have a happy 1050 and a USdoubled 1050 and have been able to rescue
quite a few old disks.
Like Dr. Wacko's guide to basic game programming is now preserved
forever in an ATR file :)

> I assume is the +5v

Don't assume. Either measure it (best) or
tell us what colour PSU wires it's connected
to. Red is 5V, yellow is 12V. Most equipment
indicator LEDs are about 1-2V, but you can
get 5V (and even 12V) ones. In fact, if you
want it to look really cool, you could change
the LED in the case for a 5V blue LED. Quite
expensive (about 10 times the cost of a normal
LED) but very cool and worth every penny.

> usually used to power those stupid
> "Mhz" displays you see on some cases. My case does not
> have this silly display.

Bah - MHz displays. So '80s!

> My question is what would it take to get this green LED
> to light when I hit the power switch? Assuming I use
> this +5V as the power source.

You'll need a resistor. What value I don't
know, so start low. If it looks dim, then
it's probably a ~2V LED, if it's really
painfully bright (and hot), it's probably a
~1V so bring the voltage down some more.
Best to change it for one where you know
the rating - LEDs don't cost that much.
I don't ever recall seeing a power LED
header on the Hades motherboard, so I
would do the same and tap it off the PSU
5V line.

You may use a tos loader with a Tos image file, downloadable from the net. I personally use one with Tos 2.06 with my 1040 Ste (installed in AUTO directory of my hard disc). Works fine ...
If you are interested in this solution I can send you back the files I use.

Good luck

Guillaume

Works fine, but it is illegal unless you own an original TOS 2.06 (in which
case it is easier to plug the 2 EPROMs into the machine and save the loader
and the used RAM).

From: bindon@madasafish.com
Message-ID: <t1lcj6st77n0d@corp.supernews.com>
Source record: 54186

Hi,

I've recently bought Diamond Back 2 off of someone (along with many other stuff). I went to install this on my ST and as I filled in the form it deleted the install.prg and something else that I'm not sure of.

So I thought I'd be clever and get it back by using undelete. I was running undelete on a spare STfm off floppy. I went to undelete the file, and it erased the disk and wrote a copy of undelete on it along with install.prg (that was corupted anyway).

What I'm asking is, if anyone could send me it. If your worried about piracy and what not, I can tell you anything about the programme, disk type, manual, serial number etc. I'm probably unlikely to use it, as I'm dreading backing up 500mb on 1.44 floppys, but I'd really like to get it back for peace of mind.

I hope this isn't deemed as piracy. Is it?

Thanks in advance

(that's the last time I'm using undelete, I suppose I should be lucky it wasn't anything too important.

There should be a connector for this LED on the board, also one for the hard drive. The latter is just in from the medial end of the mouse connector but I cannot just locate the former on the schematic that I have. There is a connector marked ELKTRON between the joystick connector and something marked KEY-E. This might be it although it has four pins.

Electrolube Thermal Bonding System.
Because I'm worth it.

> I take it your putting heat compound in the middle, then putting a few
> drops of glue in the corners.

No. That's good if you ever want to remove
the sink, but glue in the corners can fatigue
more easily (especially as most glues are not
designed for high temperature conditions, and
the minimal contact area is not good from a
stability point of view). I only use paste underneath
mechanically-clamped sinks. When I need
a free sink firmly attached I use proper thermal
adhesive throughout for maximum strength.

> I did this on an overclocked 386 (AMD 60 mhx DX!) but I must have been

> work.

You can either get rid of the atz string and replace it by the atm0 or
better put it in the dial string just before the "d". I proceed just
like this to force my Olitec modem to V34:

PREFIX = ATB20D

so maybe you could try:

PREFIX = ATM0D

Bye,
/Pascal/

Finally, found some good librarian software for the D-50 synth - 'C-Lab' explorer 32. Download, unzip, and what happens? TOS Error, program not executable.

Is this more MagiC fun, have I got a duff archive (everything else seems to work, though), or have I found some C-Lab software that doesn't run on a Falcon?

Can't find anything in the readme files to indicate Falcon (in)compatability.

Does no-one clean up their links pages? I've been trying to find out about the Afterburner and Nemesis accelerators, having submitted info for the Tempest. Endless pages of Linux, people who had one once, and one rather lame page from Cortex Design which is way out of date (hmmm.. Cortex. Who also had the Titan-BSS website, which is suspended due to nonpayment).

I'm interested in accelerating the Falcon as long as I don't have to solder anything. The instant I have to solder, I'll just leave it alone. Hence the Nemesis or Afterburner seem the best options, but even then I can't be sure since I can't find anything out about them!

Actually, the Nemesis requires fairly heavy soldering and cutting a motherboard trace. Not for you, I'd say. Afterburner (I've heard) also needs something soldered. The CT60 and Tempest (both not currently available and both in dispute about whether or not they will actually happen) say that they will allow "plug-n-play" operation, though. And Tempest will offer the option of soldering a single wire to the motherboard to improve compatibility with Falcon-only programs (I assume it's that DSP connection that the 68030 has and the PDS slot doesn't). The CT60 info page is: www.czuba-tech.com. I don't remember off-hand the Cortex page for Tempest as they've changed URL's, but there is a synopsis at: fmax.atari.org. Hope this helps!

Ah, don't worry. Found some useful sites at last. Not sure what Nemesis
is, but I see the Afterburner needs soldering and won't fit in the
standard case.

Guess I'll have to stick to 14Mb and the current speed ;)

It's not so much I don't want to solder, as I don't want to solder a
Falcon. It took long enough to get one ;)

>Afterburner (I've heard) also needs
>something soldered.

8 wires, two pins on the 030 need lifting.

>The CT60 and Tempest (both not currently available and
>both in dispute about whether or not they will actually happen) say that
>they will allow "plug-n-play" operation, though.

Tempest won't offer a big increase in speed for the apps I want to use,
though. If I want to use a different OS, I'll use a different computer
;)

>And Tempest will offer the

I didn't think the CT60 actually existed, at least the Tempest has a PCB
;)

I'm wondering why Atari bothered with the PDS slot at all, really ;)

That's the only reason why I'm thinking of switching to another product
at least for backup purposes (I don't need them for audio) but I'm
still hoping that they upgrade the data version for long filenames.

Richard,

I have an AB/Nemesis setup and there is a fair bit of soldering required. Because of the height of the AB board the whole lot is recased in a 'Desktoper'. I also have an Expose digitiser, CD, twin SCSI disks, etc in there too - so by the time you've finished you need an extra PSU, and a lot more cooling. In practice it all runs well,

Ian.

Hi Peter,

>be careful with the 3.20bx! Because I had some trouble I got back to
>the 3.13...
>The 3.20 is faster but seems to have problems with longer files...
I've no idea what you're going on about...
A good packer/unpacker should be able to handle the most stupid file
names, and that's exactly what v3.20 does. For example it should be able
to disguingish between capitols and small characters (i.e test.prg and
TEST.PRG).
It should also be able to handle files with spaces and multiple points
(test version 1.02.02.PRG), version 3.20 does all this faultlessly, the
problems you're referring to are probably caused by the OS in use that
can't handle this kind of files...

Cheers from Belgium
Dennis

6134. Best NVRAM editor for Falcon?

Newsgroup: comp.sys.atari.st
Date: 2000-11-22 00:00:00 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <BB1WmyG489G6Ewxe@lovecraft.demon.co.uk>
Source record: 53997

So far I've tried the nice looking, but seemingly not-all-there NVRAM
from Centek, NVRAM_E.CPX (seems to be the most reliable so far),
FunShip's NVRAM (didn't appear to work), and FalconSX2 which seems most
versatile.

All I want to do is check the status of the internal speaker volume.
Some of the utilities that claim to disable the speaker at boot refer to
reducing the volume of the internal speaker - but not /one/ of the ones
I have makes any reference to undoing this ;)

What does the NVRAM store, anyway?

Richard

It doesn't store anything about the internal speaker. You can configure
all NVRAM parameters with BOOTCONF,
http://home.nikocity.de/nogfradelt/atari_english.html.
Any other settings are no NVRAM settings.

Hmmm. That makes sense, I wonder why some programs claim to change such
a setting. From what I can tell, I can set language, screen parameters,
and time/date preferences.

I've emailed you about HDDRIVER, btw ;)

Have you tried MAME? I think it might have an emulator for ST... not sure
though...

You want NoSTalgia or PowerST. You could even try MagiCMac (for apps,
not gaming). Search for the first two @ www.versiontracker.com

Well, unfortunatly that little bit of fun has been put on hold. I've
just got an email from Anodyne quote "The difficulty with using the
ICD Link with CD recorders is that the Link does not support a SCSI
feature called "Arbitration" which most CD recorders require".

Some of the old CD recorders will work, but I'd rather have a new one,
so I'm buying a new computer hopefully.

Does anyone know who owns the rights to Diamond Back? I'm trying to
find the guy in AC (in the news section) as he recently bought (got
given) the rights to Diamond edge/back.

I'll keep on searching.....

Thanks for the help.

Only an initiator ID (meaning that the ST has its own unique SCSI ID) is
required with such devices. The LINK96/97 by WB Systemtechnik supports
this.

From: "Claes Holmerup" <newsgroups@holmerup.com>
Date: Mon, 20 Nov 2000 23:37:25 +0100

Hi Claes,

>(but at least, you can get the compatibility list from SoundPool's website
>and check it before you go shopping for a writer) -
True, but that list is hopelessly outdated... nothing which is on that list
is actually for sale anymore. Does SoundPool really expect their customers
to go hunting on eBay?

>but I believe it's the only burning program which handles audio CD's
>correctly, with possibility to write indexes, individual pauses between
>tracks, pre-emphasis etc. It always burns audio as disk-at-once, which is
>required if you're going to make mass-duplication at a CD-pressing plant
>(if you use other than disk-at-once and a fully compatible 'red book'
>burned CD, they have to make a new master on tape before making the glass
>master)...
True again, however not everyone needs all the "posh" features. Try imagine
someone who is pretty pleased if he's able making a copy of his favourite
CD's.
While CD Recorder Audio hardly needs improvements, CD Recorder Pro is the
problem. Someone here already mentioned the lack of support of LFN. Except
for my bootpartition, I use LFN for all the others. If I want to make a
backup of these partitions or just some single files, the only option open
with CD Recorder Pro is to pack all the files before dumping them to the
burner. This is not my idea of backing up....
Another thing that's been bugging me is the lack of support for re-writers,
I don't mean the option of wiping a CD-RW clean, but being able to use it
like it's intented to.

>>I've been playing a little with CDLAB, and although it's still limited in
>>features, this is the package I would recommend to anyone that sets his
>>first steps in the minefield.
>Does it handle audio burning correctly? Very many Falcon users are
>musicians, so that's probably the main issue...
It burns audio as disk-at-once.... so yes. But TBH it's not as versatile as
Soundpools offering. As a musician it probably wouldn't suit your needs, but
not everyones main issue is music...
Currently the following is supported by CD Lab:

. Copy mono-session CDs of various types :
- Classical CD-ROM (mode 1) ;
- XA CD-ROM (mode 2) ;
- audio CD ;
- mixed CD.

. Copy in DAO mode (disc-at-once)
. "On the fly" copy, which means directly from player to recorder, or
the possibility to create an intermediary file on your harddrive before
you actually start the burn process ;
. CD Table of Contents (TOC) analysis ;
. CD-audio track extraction ;

So yes... it's still pretty basic compared to CDRecorder Pro and Audio, but
compared with Anodynes CDWriter it's a better match...
For someone setting his first steps into "burning CD's", this package is
perfect, once he's more experienced and find he needs additional features
then he can always look at the two commercial offerings...

BTW: CD LAB can burn CD's in RAW mode if supported by the writer, ever tried
to copy a PSX CD perfectly? with CD LAB it's no problem at all... same thing
for Mac CD's or CD's with "weird" tracks.

For once that I support a shareware program here openly instead of breaking
it down, bare with me and take a look at http://cdlab.atari.org , you'll be
pleasantly surprised...;-)

Cheers from Belgium
Dennis

I've kind of been out of the Atari scene for a couple of years. Used to be my #1 hobby, but life takes it's twists & turns. So, I have a couple questions, hope I'm not repeating things that have been discussed endlessly. :)

Are there any Atari publications left that would be like a magazine?

Any web browsers/ internet packages that are stable & available for ppp connections? (My experiences 2 years ago left a bit to be desired... ;)

What is left of the old Atari company, JBS was it, that made mini-hard drives of late? Did they fold, still going, ...

Any of the old gang of Atari software supporters left? (Guess that's an open question, I'll just hang around & see if the names float by.)

Thanks. Oh, I've still got the ST, MSTE, TT, Falcon, and so on, just haven't had time to use them. Maybe this winter life will settle down a little.

Some installations like what you are looking at usually means some
soldering is needed. However some memory upgrades involve some easier
methods. Best Electronics is a very reliable company and I would not
hesitate to trust them. I have 4meg in my STe and it has come in handy when
using programs like Cab and PageStream. The more memory the better.

The Blitter Chip helps to speed up the way things go on the Atari computer. Things run much faster. You can use an external SCSI HD with no problems. IDE is possible with a hardware upgrade from Mario Becroft. The best hard disk driver is HDDriver, but the ICD driver is ok also.

>I have a b&w monitor from my old setup so I can use that, can I hook the

I am not sure. I have heard of such things. You can also use a TV if you have a STfm.

TigerCub is great on the 1040. That runs great on my 1040Ste. You need an external modem, Cab (browser) and STik2 for a PPP connection. For email you can use Newsie and Popwatch. For graphics you can only get things in mono. For color graphics you would need a Falcon, Milan, TT or Hades.

Perhaps you mean _if_ I start using LFN etc. I don't intend to, at least on the Atari. I am happy with 8+3, original TOS, no fancy icons, monochrome screen etc boring etc :-)

I just got ahold of a refurbished LaCie SCSI external (with a Yamaha 4x4x16 CDRW) for $129 US. So far it's worked great with my UMAX and Adaptec Toast. Ken Macdonald has an internal SCSI Yamaha which he uses with his Falcon and the Anodyne software, and he's told me it also works great. We're talking about doing a CD recording night as an upcoming TAF meeting, probably around January or February.

When I did the research on which drives were the best for CD-RW, I checked the MacFixit site. The four names that kept popping up were (in order) Plextor, Yamaha, LaCie and Ricoh .

BTW, for some good deals for North American Atari users check out the Small Dog Electronics site
(http://www.smalldog.com), that's where I got the LaCie on one of their weekly specials . You just have to be patient and wait for a special to pop up :)

6165. For Sale

Newsgroup: comp.sys.atari.st
Date: 2000-11-22 00:00:00 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <3A1C8402.B7EBEDA3@greeleynet.com>
Source record: 54028

Closet cleaning time. The following system has been unused for at least 5 years, and I have no plans for it. It worked fine when last assembled.
****

1040 STf with Avant Garde PC Ditto II w/ 8087 math coprocessor installed

SC1224 color monitor
SF 314 external 720k floppy
IB Drive external 5.25 floppy w/ original disk
Cable for switching between the external drives
Atari mouse
30 meg hard drive in Mega "pizza box" style case

Computer and monitor look almost new. Very little us as soon after I obtained a Mega 4.
Computer has a small bulge in the top of the case due to the PC Ditto II board installation. (You can lay the blame on Atari for that problem. There were a lot of internal case design changes that were not apparent from the outside.)

Atari software:

Word Perfect for the Atari
Drafix CAD for the Atari (B&C Computervisions was asking $175 for a copy the last time I checked. Drafix is now owned by Autodesk (AutoCAD) and the current version is called QuickCAD. No support for any Drafix title prior to Version 4. This is version 1.)
Hyperfont (create GEM fonts)
Turbo ST by Soft Trek (speed up screen rewrites, similar to Warp 9 from Codehead)
Art & Film Director by Epyx
Universal Item Selector
Computer Guide to the Solar System
Anthena II CAD by Iliad
GFA Draft Plus
Easy Draw 3.0 by Migraph
ProText version 4 I believe
Logistix - a Lotus 1-2-3 compatible spreadsheet
The Graphic Artist w/ Font editor - A cad style drawing program, unfortunately it does not do dimensioning, but you can create your own plotter drivers.
Deluxe Paint
The Juggler desk accessory - similar to MultiDesk from Codehead
Flexcessory desk accessory - similar to Juggler/MultiDesk but runs programs rather than accessories

All the above software is original and has the manuals.

MS-DOS Software:

Phoenix MS DOS 3.3
Central Point management tools version 7.?
PC Ditto II program
GEM/3 Desktop from Digital Research (The IBM version of the Atari GEM operating system)
GEM Artline from Digital Research (GEM program that looks identical to Easy Draw but also has the ability to paste your objects on a grid to create a flag waving, text along a path, etc.)

The above software is orginal and has the manuals.

Envision Publisher - a shareware desktop publisher that I downloaded
Resumï¿½ Creator - no manual came with this software, original disk
Jetfighter I - no manual came with this software, original disk
2 shareware vehicle maintenance programs, no manual provided
Lots of clip art disks, 5.25 format

Books and accompanying floppies about hard drives used on Intel machines of the time and a book of very useful DOS utilities and about DOS 3.x itself. Very useful.

Other misc DOS stuff and programs, sources unknown.

$500 for the lot. Buyer pays shipping and any insurace costs. First person willing to buy for the asking price gets it. Email by midnight (Rocky Mountain time) November 30 gets it. Cash, money order, cashiers check, etc., no checks. If it doesn't sell, it goes to Ebay.

Thanks.

Ken

>My Falcon's FPU was supplied by Best Electronics, who are online

There's no mystery about FPUs, should be available from such places as
Maplin. Strongly recommend the 30MHz version, to allow for any future
upgrade to an accelerator (this speed FPU will be fine at 50MHz, E&OE).

Adaptors can be home-made, download Robert's DoitF030 archives for info
on this and a whole lot of other Falcon info (mostly in German, apply
using the form on the page for a password to unlock the archives).

That depends on your Desktop really, if your using plain magic then you'l
have to add them to your RSC file. I use Jinnee which allows multiple RSC
files, in that case i add icons to a 'specific to an application' file.
At the moment ive got 67 resource files totaling about 2 meg in size.

>
<snip>

The program referred to is called Anadisk as in to analyze a disk.
It runs in real DOS mode on a PC and is quite powerful and full of
features. Unfortunately, at least on my PC, it won't read a disk
written by my 1050s for anything. It seems to be locked into insisting
on the beginning of a track being under the index hole and when that
situation does not occur, it fills in data with sector data that just
doesn't exist, rearranging sectors along the way. A companion program
called Deana then takes a disk scan created by Anadisk, flips each byte
of data, writes a header and turns the disk scan into an .atr image.
But since I can't gather valid data, I don't get a working atr.
Perhaps those who claim success with Anadisk will enlighten us with
some PC specs, in particular the exact 5 1/4" drive they are using. I
also wonder if a disk written by a XF551 drive would be readable on my
PC as the 1050 ignores the index hole altogether and also runs at a
different RPM thus scattering sectors willy nilly according to the
index hole, but the XF551 might have the capability to write an Anadisk
readable disk as it uses a PC style drive mechanism.
If readable, boot disks would be converted into atr files and the
same is true of Sparta DSDD. Anadisk can be set to read either one
side or both, but since I can't get there from here, I don't know if
Deana can convert such a file into a valid atr.
A PC program that does work for me is Util by Charles Marslett of
MyDOS fame. With the proper command line invocation it will format a
MyDOS double density disk in your PC that you can then use to transfer
files back and forth between the PC and your Atari. This would
include .dcm files of boot disks and then there are PC programs that
will take a .dcm file and turn it into an atr on the PC ready for
emulator use. On the Pool Disk Too set one can find a version of Util
written to do it in SpartaDOS format instead of MyDOS. Search this
message group for Pool Disk and you should find an email address to
inquire about purchasing the two CD disk set for yourself. Included is
all the above programs with a documentation file on the Util programs
that explains the various switches to use, with examples much better
than the original release does.

A couple of sites that also contain some of these files are

6186. 4MB atari question

Newsgroup: comp.sys.atari.st
Date: 2000-11-22 00:00:00 UTC
From: Lurker <lurker@bok.co.za>
Message-ID: <8vgdm3$17cr$1@nnrp01.ops.uunet.co.za>
Source record: 54142

Hi there,
I was a 1040 owner but my PSU burnt out, however, I just
sourced a 4MB atari seperate Keybd, 4MB ram and a blitter chip?
What does the blitter chip do (wasnt on my ST(fm)), can I fit a HD? if so
ide, scsi, 2.5 or 3.5"
I have a b&w monitor from my old setup so I can use that, can I hook the
comp up to my PC monitor? Is it a nightmare?
And lastly, how can I get downloaded softwarte on the box, do I need a
terminal prog and a serial cable and download from internet to PC and from
PC to atari?
all answers greatfully received.
Im going to use it mainly for Music (Dr T software) but would like to use
some old games on it (need colour tv or monitor) want to play player manager
and kickoff :)

>just Curious.

4MB-populated Marpet boards (with
soldered-in SIP modules, for best reliability)
have been sold by System Solutions for
approximately 2 years at £99.00 inc. VAT.

System Solutions bought the rights to the
Marpet boards about 3 years ago, so anything
else is either old stock (nothing wrong with
that so long as it works and comes with
warranty) or not legitimately manufactured.

>rather that Tempest didn't expire...

'ang on. Why do people from *.gothic groups keep following me around?

Cortex have a site, selling the Tempest (idea, at least) - with the
confidence-inspiring URL of:

http://www.cortex-design.free4all.co.uk/

Get there before it falls over, or something. The titan-bss site has a
nice big logo saying the account was pulled for non-payment, but having
dealt with the sort of company that does things like that before, I'm
sure there will be more to it than that.

They also sell cheap PCs with painfully nasty specifications. Joy of
joys, Nemesis is on there too ;)

This sounds similar to a problem I had with my Mega STe.
Apparently some of the early ones had a bugged PAL chip. The only way to
correct the problem was by replacing this chip. Maybe someone more
familiar with the technical issues can provide more details.

|
|I was wondering what that connector was. Ed seems to think
|his CPU cooling fan is connect there. However his view is
|obstructed by the case or some drives so he is not 100% sure on
|that.

I have just taken the top off the case and can confirm that I have plugged the green power LED socket (white and green cable) onto the ELKTRON socket. The plug I have is three pins wide with the white wire at one end, the green wire at the other end and nothing in the middle. The socket, however, is four pins wide.

My schematic says (in German) that pin 1 is always to the left (i.e. towards the keyboard connector/power sockets end). Keeping this convention then the white wire goes to pin 1 and the green wire to pin 3. Pin 2 is enclosed by the plug but not connected to anything and pin 4 stands on its own outside the plug.

NOTE: It is quite possible, even very likely, that this socket is indeed intended for something else such as a cooling fan. In that case I may well be tapping off 5V and either I have a very forbearing LED or the manufacturers have a resistor in series in the LED assembly itself. Perhaps you can get LEDs with a series resistor built-in for 5V operation? ---- pause of two minutes while the Maplin catalogue is consulted ---- yes, you can get red and green LEDs that work off 5V (costing 29 pence for one including tax). I guess I was lucky when I plugged that thing in.

>I'm not holding my breath though ;-)

If it were to run AmigaDE natively, it would have to use a hardware
implementation of the Taos virtual processor. Much like the Java chips which
Sun once produced. I haven't heard Amiga declaring any such intention.

>>>I don't see this as a bad thing.

>is to support most of the modern features that people expect.

Why so? It has got a far more open design than MacOS, and has got most modern
services available. I believe this is just a popular myth.
Right now, as we are speaking, Amiga are apparently working on making an OS
out of the framework that is Taos. In other words, they've got not much more
than a kernel. OTOH, AmigaOS has got an entire OS, with a developed userspace
and experienced programmers.

>Problem is, Amiga Corp would need a lot of time and effort (read money) to
>do this and given the small market, this wouldn't be possible financially.

Then let it be. If they aren't up to the task, they shouldn't even try.
It's really odd that they can't manage what the miniscule WarpOS theme are

accomplishing.

>Question then is, how compatible would such an OS likely to be and is an
>integrated emulation that is capable of running 98% of software and faster
>than any classic Amiga today is capable of really that unacceptable?

UAE? Been there, done that.

>(Bearing in mind that this question is somewhat hypothetical given that we
>don't actually know how well or how fast such an emulation would work)

We certainly don't.

Flying. I had the Modem2 port operating at 115k earlier tonight, but I kept
getting 'Write Fail' messages. Maybe it's because I have the Write
Verify option from ICD's HD software turned on. Then again, Write
Verify maybe the only thing saving my HD from getting scrambled
during one of those 'Write fails'. I'm gonna slow Modem2 down a
notch and see how that works.

I want to thank everyone who responded to this thread. Because of your suggestions, I now have successfully used Newsie and CAB at a DTE speed of 115200 bps.

Now I have one more problem - I think. CAB and Newsie are both hard drive intensive. While connected at that speed, my ICD HD software occasionally reports a 'Write Fail' error. I have Write Verify enabled, and I assume the error message is from that. However, when I later checked the files where the error occurred, they were fine.

If Write Verify works the same way it does on the 8-bit computers, the sector with the error would have been written a second time, in an attempt to correct the problem. If this were an 8-bit computer, I'd say the error was a result of interupt timing conflicts between the modem 2 port and the HD.

My question: Should I continue to run at 115200 and hope the HD software will compensate, or am I courting disaster? Should I cut the speed down to 56k?(I tried 78k - the modem won't accept it) I don't want to scramble my HD, but then I don't want to limp when I could fly, either.

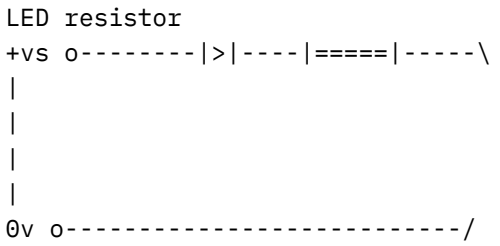
Measure the voltage between the 2 wires and, if it's 5v connect a 330 ohm resistor, or if it's 12v use a 1k0 (1000) ohm resistor, in series with the LED. i.e. it should look something like this:



Regards,
David Bolt

Hmmm, check your hardware control. The modem should wait automatically
when the data comes in too fast. You may also want to check if your
drive is happy -- it'll be working much harder now.

Agreed, as the internal speaker is not of very good quality. Attach
some powered speakers to the headphone jack and you'll have much better
sound.

Using software you paid for isn't piracy. With Oregon Research gone,
your request is the only way you can get your copy replaced, but I'm
afraid I personally can't help. Good luck!

With a 500 MB HD you should start saving your pennies for a CDR and
software. It'll be much nicer.

Try heat-sinks. I've had good results
sticking them on SGRAMs as well
(no psychedelic colours randomly
appearing in textures when overclocked).

see www.atari.com - hasbro bought the atari bit. 23rd febuary 1998. see :
http://joshuawaller.tripod.com/text/hasbro.txt for more information. they
don't seem to do anything with atari except make re-releases of atari's old
games such as centipede etc. demos can be downloaded from the site. hard
drivin might be cool on the PC if they do that.

if interested in selling any of the mste. tt. falcon then let me know :o)

thanks

> only? URL? Give! :-)
>
Um...it's a new VME-Bus graphics card...it will have ethernet too when it's finalised...TT only ATM, should get a Mega STe driver sooner or later.....trying to get it Cubase compatible as well....It's Mario's new product, I was showing people the board at Stafford...if I had realised what a doddle it was to get going (turn off machine, stick board in, turn on machine, load software, reboot) than I'd have had it running there too....It's currently got 8Mb of memory so it can manage some enormous resolutions and colour depths.....but I'm really trying to get it running with Cubase cos that would be of most use to me, as well as there being a bunch of musos who want one.....TTM monitors are hard to get hold of, a 19" SVGA isn't, and with a switch box you only need one monitor to handle both your sequencing TT/MegaSTe and your recording Falcon/PC/Mac....plus sooner or later there will be driver codes for 1600x1200 for those of us with 21" and bigger......Cubase (and Calamus) will look great on that....

The thing that worries me about FAT 32 and LFN is what happens if something get's corrupted on the HD and you can't access Magic or Mint. Sometimes TOS is useful and if you can't access the HD then your stuck. Someone here has boot partition as normal and all the other partitions as LFN. Is it possible to have a C partiton in FAT16 and all the other parttions as FAT32?

Is that a joke?!!? Maplin are going down hill unfortunatly and
recently they've stoped selling their range of 17,000 semiconductors
and now (in a space of a year) is about 500, if that. They used to
sell 020 up to 040 but not anymore.

That's why I'm switching to Farnell.

>Strongly recommend the 30MHz version, to allow for any future

Short on words, but very direct, lol. You can do it, I've known (in the distant past) ppl who have run it all from a 720K drive. does not help much for the WWW though unless you want to wait a year or 2 for disc accesses :P what you still doing with a 720K drive anyhow ? Ain't you in the 90's yet and got yourself a 1.44 meg drive ?!?!! seesh.......lol

>and got yourself a 1.44 meg drive ?!?!! seesh.......lol

If you have a Mac or PC, I hate to be devil's advocate, but /why?/. I've
tried using CAB on my Falcon to browse the HTML catalogues on CDs, and
it's so painfully slow it's actually quicker to take the CD to my PC,
print out the catalogue, and just use the printed one to locate files.

It's possible to access the net on a 2.8MHz Apple IIgs, but why anyone
would want to is beyond me ;)

I didn't think to look and see if the LED had a resistor already
inline with it. Just looked and it doesn't. I'm not brave
enough to plug it in though, I'll try some resistors first
inline and see how bright it is and go from there.
Thanks for the information.

I'm quoting myself now, but I just measured the voltage at
the ELKTRON connector and it was appox. 2.5volts, which
may explain why you had good results connecting the green
LED there.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To make room for new stock, Bravo Sierra Computers is holding a YearEnd
Holiday Sale. Everything is 10%-30% off! Atari Orders for $50 and up
are 10% off, Orders $100 and up are 20% off and orders $150 and up are
30% off provided the customer claims the discount in E-Mail. This Sale
covers Atari Jaguar, 8-Bit & ST. This Sale does not cover Monitors.
Customer pays Shipping. So order now while supplies last. Get your free
Atari catalogs at: www.atari.benjamin.net or E-Mail atari@benjamin.net

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Hello, my name is Benjamin Smith. I'm a Collector & Jaguar Game Player.
With all my games to play, I have no one to play Games with on my Atari
Jaguar. I live in Portland, Oregon. USA and I'm looking for Atarians to
play Jaguar Games with. You don't necessarily have to have a Jaguar.
Most any Atari will do. I'm thinking of starting Atari meetings in
Portland. Focused on Gaming but still supporting any Ataris. Call Ben
anytime at (503)256-9974 or E-Mail:

e-mail: atari@benjamin.net

If I'm unable to answer, leave a message and I'll call you back.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or

6228. Pulling my leg?

Newsgroup: comp.sys.atari.st
Date: 2000-11-23 00:00:00 UTC
From: factvacuum@aol.com
Message-ID: <factvacuum-ya02408000R2311002317500001@news.aloha.net>
Source record: 54063

I have a few Atari STs from times immemorial, and I sometimes run an ancient version of Cubase sequencer on them. As far as I understood, that was the peak where the Atari line got, MIDI-wise, not counting the direct-to-HD capabilities of the Falcon which got unfortunately discontinued.

An hour ago I stumbled on a page of Softjee Systems, (http://www.softjee.com/anglais2/dhs.htm) which sells direct-to-HD proggies, software samplers, etc - for the Atari? And these run on... BeOS? ...Like... someone ported BeOS to the Atari?

Is someone pulling my leg ?

Yeah there are 2 great emulators PowerST and NoSTalgia written by the
same guy. Anyhow the best place to find anything about emulation would
be to stop by www.emulation.net You'll find links to ST emulators plus
others.

I still have my ste in basement. Not sure what to do with the thing.

This Unix is a System V Release 4.0, X11R4, Motif 1.1, and was only
available for developers. The prices was about 4000 DM (don't know the
precise amount anymore) on a 230 MByte Maxtor drive. Note: This price
didn't include any TT hardware, of course.
When it was released it was one of the first SVR4 implementations that
were available at all. Nowadays it's more of a historical value, since
using Linux makes more sense.

No, he's ported the programs to BeOS.
A lot of those programs were made on
the Falcon years ago and are now
available for BeOS.

Yes, in principle it is true, but who will
do it? What did you emulate on your
STFM? That must have been a long
time ago.

Not as much as they would programming
native games.

More precisely, it's a direct memory access
device which moves blocks of memory
around much faster than the 68000 can,
and is also capable of performing logical
masking operations (AND, OR...) on data.
Its ideal for graphics manipulation but does not
automatically accelerate everything. Software
must be programmed to take advantage of
it, much like an FPU.

Depends what type of PC monitor. (S)VGA
should be fine, anything predating those
standards, unlikely.

Please note that putting in a faster part
doesn't automatically make the machine
run faster. It just means it can tolerate a
higher frequency clock signal, and as I
mentioned in an earlier post, overclocking
the FPU fitted on the motherboard is
quite limited because you're still limited
by the speed and width of the system bus.

If you mean those Mitsubishi DiamondTron NF 22",
check the visible area. Less than or the same as most 21".
You need 16:9 (1600x900 or 1920x1080) or
16:10 (1920x1200) for currently available >21/22".

But it doesn't do any harm to have the faster unit, so if you do speed
up the rest of the machine, you don't have to replace your FPU ;)

>PC PSU? or use somthing else?
>Any ideas gratefully accepted.

You can modify a PC PSU - I have done so myself, or you can buy an
adaptor from Chris Crosskey who lurks around here someplace. Lead
colours can vary from PSU to PSU, so the adaptor is the safest way, but
if you check the layout of an AT PSU, you can work out which lead is
which.

The PC PSU will have to sit externally, but you can also use it to power
other devices like external floppies ;)

Wildcard matching in "Find Multiple" was case sensitive.
Not very practical if you want to browse a Minix partition.
So I changed that.

I dont have a ext2 FS. So I dont know if it works on ext2.

If somebody wants to try, please let me know.

I also changed a little bit in the UNDO.
There is now a option to limit the amount.

Its all on my homepage (in sig).

Just for your infor dipstick, I happen to be running the (un)intel machine because I had to get a working computer to use on the internet. My TT's keyboard totaly died on me and my falcon blew it's power supply and the one 1040 I have doesn't have a hard drive, plus as I run many lists on egroups.com, to do any work on them I had to have a machine that had java support, something that's lacking on the Atari platform.

Hi Chris,

>> >BTW....Galaxy resolutions are really cool and you guys will be blown

>Um...it's a new VME-Bus graphics card...it will have ethernet too when
>it's finalised...TT only ATM, should get a Mega STe driver sooner or
>later.....trying to get it Cubase compatible as well....It's Mario's

Good, I didn't know that Mario had chosen a name for this card.

>new product, I was showing people the board at Stafford...if I had
>realised what a doddle it was to get going (turn off machine, stick
>board in, turn on machine, load software, reboot) than I'd have had it

Truly plu'n'play :-)

Seems the main complaint about graphics cards is screen drivers - does
this one use NVDI or Fenix?

>codes for 1600x1200 for those of us with 21" and bigger......Cubase
>(and Calamus) will look great on that....

Grr! :-)

No-one have any news about a good graphics card for my CT2B'd Falcon? This
would truly make my day...

Someone in this NG was fitting a Nova card to a CT2B'd Falcon a while back
- but he never reported back :-(

>Mint. Sometimes TOS is useful and if you can't access the HD then

Don't panic, as the file system stores an 8+3 version of the filename as
well as LFNs. This also applies to Windows BTW.

>other partitions as LFN. Is it possible to have a C partiton in FAT16
>and all the other parttions as FAT32?

Yes, by using the VFAT utility supplied with MagiC (MiNT will have its own
way of doing this). You can turn LFNs on and off at will, providing that
you'd already opened the partition previously, otherwise that drive letter
will not be active in the utility.

Yes. Set up a 1Mb ramdisc and tell CAB to store the cache on the
ramdisc. Sting or Stik will work from floppy, as will CAB. I actually
ended up using this sort of system when my EZ135 died. The only
difference between the above 1040STE and mine was I had an HD floppy
upgrade and had Sting, Newsie, CAB and POPwatch on the one floppy.

6267. Atari emulator for PlayStation 2

Newsgroup: comp.sys.atari.st
Date: 2000-11-24 05:29:37 UTC
From: ahbr17912@blueyonder.co.uk
Message-ID: <51nT5.7030$ws2.1021957@news3.cableinet.net>
Source record: 54065

Is there any news of an Atari emulator for the new Playstation II?

The principle that the more powerful machine can emulate all the
others was a principal reason for my buying an STFM.

It would be great to run all my nice Falcon and ST software on
a Playstation II. And whoever programmes it will likely make
a whole heap of money!

Stuff the boring, unreliable and insecure Windoze boxes...

JH

Yes, this is perfectly feasible. CAB 1.5 will run from a 720k
floppy. An incomplete CAB 2.7 will also run OK.

The trick is to set up a reset-proof RAMDISK for the WWW cache.

RDE 5.0 is ideal for this, as you can preload programs into it.

I've done this, with both browsers. So can you.

I'm looking at a nearby backup system right now!

CAB 1.5 is a freebie, as is RDE 5.0

Use STiNG and HSMODEM.

It helps if you have a 24/7 free ISP

:)

It's not black, it's actually gun-metal grey,
with black trim and turquoise graphics.

A great site for emulation on the Mac is emulation.net. They've got good ST and 8-bit sections..

I would recommend (as others have) PowerST or NoSTalgia. Also, if you want
to create "disk images" from your existing ST disks, you'll need the utility
"Dust."

One other note - Dust will NOT work with USB-equipped Macs (G3, G4, iMac,
and iBook) unless you install the "USB Floppy Enabler v2.0". Apparently DUST
makes some calls directly to the floppy controller chip used in the older
Macs. This software fix reroutes those calls so that the USB drives work
properly with software written for the old Macs.

Here is a link to download the Floppy Enabler:
http://www.paceap.com/usb_enabler_v2_0.hqx

Hi Joshua!

> ooops stacys are $899 from best electronics. not $399/. sorry.

IMO a little bit too expensive for an 11 years old machine.
I bought an ST-Book (one of the 1000 produced) 2 years ago for approx. $150
(depends on exchange rate) from a privat person. Also as a collector's item
it's not worth much more.

Best regards, Werner

Once upon a time <3A1F916D.2574CD0E@intergate.bc.ca>, Artur Stachon
<astachon@intergate.bc.ca> grabbed chalk and scrawled:
>How is it to browse the net with Falcon ?

Tolerable. Just.

>Isn't it slow ?

Very.

>Can you see
>graphics or only text ?

Graphics and text, CAB seems to have good support for most formats. It
uses external decoders, however, so it can be quite tedious.

> I had 486/66mhz and it was pretty slow so I
>cannot imagine 16mhz atari falcon for web browsing or 8mhz atari st!

Probably about the same, actually. The Falcon isn't that slow a computer
and the OS is largely ROM based.

>Maybe Atari TT or something like GEMULATOR ?

If you're running GEMULATOR, why would you want to browse the net
through that?

The TT isn't a great deal faster than the Falcon - in fact, some are
16MHz too.

>Any ideas ?

If the Atari is your only computer, you can use it to get online. If
there are downloads you want and can't get on a floppy, then yes, you
can get them directly.

If you have pretty much anything newer, use that instead if you just
want to look at the internet.

Richard

Hi Philippe,

I am not the expert but they are being sold here in Holland
from $125,- up to $150,- including screen. Sometimes even with
the 19" screens. And on the other hand tey are sometimes sold
for more. Not far fom here in Germany the cost a lot more.
Eventually because there is a more lively Atari scene. Then the
prize goes up to $500,-. So it is depending on the old economic
law of need and availability.

> Regards, Robert

Hello,

I am nut sure if this is of any use.
I have a Midi Plus Port B for the Atari 520/1040ST
made by Sonus

It looks like an RS232 (25 pin female) Connected with a short cable
to a black box with one midi port that says sonus out.

I never used it, 'cause I did not want to tie up my RS232 port.
{unless you use some sort of data switch}
You probably could use it on a Falcon with a 25 to 9 pin adapter.
But your only getting 1 midi out.

ken

Hi all,

I've just added "Photo" to my web site (Misc section). This patch for Photo Line adds a new window into which you may add tools for instant access, as well as AV support and some new keyboard shortcuts (this isn't 100% on a UK keyboard).

You'll need a multitasking environment to run this utility.

> it have something to do with the Centurbo, perhaps running it too fast?
> Does anyone know of a program that would verify if a DSP chip is working?

1. Use the Atari diagnostic. This will tell you
if the DSP SRAM is faulty (more likely)
2. Your DSP clock wire perhaps not
separated from the SDMA 25MHz, or has
moved somehow and is picking up interference,
maybe even come loose or completely off!
3. Your DSP may be faulty, though I've seen
countless Falcon DSPs run at 50MHz for
years with no problem
4. You have old DSP timing? Run the CENTBENCH
program, if you get something like 475MHz for the
DSP speed, you have old timings.

>the error occurred, they were fine.

This is interesting (to me, at least...). I also occasionally get
"write fail" message from ICD software. It happens sometimes when copying
very large files and it even happened a couple of times when I defragmented
a partition using Diamond Edge. Yet, as far as I could see, this
"write fail" never produced any harm at all. Yet, it makes me feel uneasy...

I found that the occurence of this error was VERY dependent on size
setting for "verify bufffer" in ICD disk driver. It also seemed to
occur more frequently when STiNG was set with lower value for
"delay" in STiNG CPX, but I am not very sure about this.

Can somebody comment on the cause and remedy (if any) for this?
(ok, I know I should get HDDriver, but I'll have to bear with ICD for
the time being...)

Hi Lyndon,

>The thing that worries me about FAT 32 and LFN is what happens if
>something get's corrupted on the HD and you can't access Magic or
>Mint.
MagiC can be booted easily from disk... so there's no problem really. Just create a "rescue disk" which holds HDDriver, MagiC and Magxdesk (a minimal installation of the desktop is sufficient), a couple of CPX's and you're ready to roll in case things go horribly wrong... there's plenty of room left on the disk for NVDI and a MetaDOS CD Driver as well.
In general it's a good idea to leave the bootpartition in standard 8+3 format and keep the size of that partition to normal proportions, i.e 20MB should be more then adequate.

Cheers from Belgium
Dennis

I wouldn't dream of telling anyone what to do with their computer... but it seems like a terrible waste to me using a Hades in the way you describe. The setup you describe doesn't even need Diamond Edge, Atari Chkdisk 3.0 will do an equally good job. Granted... it's a boring program but at least it will match the rest of the setup ;-)

A well configured OS on the 486 will easily whip the Falcons butt. If
you ran win 3.1 (not 95) and trumpet winsock with Opera then you'll
see it fly. Goes quite fast on a 386 SX32 so I could imagine it to be
pretty fast. Also has support for Flash, Java etc etc.

Sorry to go on about PCs but we are lacking, unfortunatly.

6311. Is there a FPU-test utility?

Newsgroup: comp.sys.atari.st
Date: 2000-11-25 00:00:00 UTC
From: vdjole@EUnet.yu
Message-ID: <8vpb4pdv1@SOLAIR2.EUnet.yu>
Source record: 53995

Does anybody know of a utility that can extensively test a FPU in an Atari machine? Not just whether it is present but also the status flags and numerical accuracy. And it should be able to work on a 68000 cpu.

The reason for asking is that I want to meddle a little, hardware-wise, with a FPU in my computer (overclocking, etc) and I have been warned that overclocking a MC6888X can lead to floating-point errors (i.e. everything seems to be correct, but it isn't). So I want to be able to check that the little board will continue to work ok.

And the reason for asking that the software should work on a 68000 is that this here is a MegaST with a memory-mapped FPU (like the SFP004) and with a LineF-FPU-emulator it can chew data intended for the other type of FPU connection- but many software authors seem to think that a FPU can only be used with 68020 and above, so if they compile a FPU-supporting version they apparently mix it with 32-bit code, even though the software otherwise works on a 68000.

Thanx in advance.

6312. Extra MIDI ports on Falcon

Newsgroup: comp.sys.atari.st
Date: 2000-11-25 00:04:24 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <VN4T1xAIIwH6Ewrf@lovecraft.demon.co.uk>
Source record: 53966

Much weirdness.

I noticed a box on Master Tracks Pro configuration that allows you to
use the RS-232 as extra MIDI ports. Does such an expansion exist for the
Falcon (or could I use Mac MIDI ports in the 'net' port?)

The standard 16 parts are not enough - my GM synth takes them all and
leaves no room for other devices...

Richard

I get a lot more than that, especially with Newsie. I tend to read both my mail and newsgroups offline, so I don't tie up my only phone line any more than I have to. There are four adults here, and I'm the only one online. They have a right to the use of the phone, too. While I'm downloading, naturally there's a lot of drive action going on.

>>While connected at that speed, my ICD HD software occasionally
>>reports a 'Write Fail' error. I have Write Verify enabled, and I assume
>>the error message is from that.
>
>I suggest you switch of Write Verify as your SCSI drive will do this job
>on its own anyway, and increase your cache buffers. I also suggest you
>disable delayed write if its on.
>
Well, that'll get rid of the error message, anyway. I found the Write Verify section of the ICD manual, and that message is indeed from that. I also see where if I disable it, write speed should increase by about 50%. I've always had verify enabled for this Syquest 44 removable, never noticed where it was slow enough to bother before. I believe the delayed write is on, but I don't remember the length of the delay offhand.

I'll give it a shot and see what happens. I'll also install STinG 1.26. I'm still using 1.22. Might it make any difference if I use SERIAL 2 instead of MODEM 2 for my port? The STinG 1.26 doc seems to recommend it.

6316. DSP chip goes south

Newsgroup: comp.sys.atari.st
Date: 2000-11-25 03:16:12 UTC
From: fried@dragon.achilles.net
Message-ID: <8vnats$4sr$1@localhost.localdomain>
Source record: 53969

hello to any Falcon experts,
It seems like the DSP chip on my Falcon has given up the ghost.
I have a Falcon with Centurbo II installed, and that is working pretty
well, but any prog. that uses the DSP won't boot up.
So, for example I can load up the midi only portion of Cubase audio,
but not the audio part. Or if I use Aniplayer, I can view a JPG file,
but only if I disable "use DSP" in the menu. Other progs. that only use
the CPU seem to work OK. Could my DSP chip simply have burnt out? Or does
it have something to do with the Centurbo, perhaps running it too fast?
Does anyone know of a program that would verify if a DSP chip is working?

computers are like soap operas sometimes.
Any help is vastly appreciated,
Mark

Artur Stachon <astachon@intergate.bc.ca> wrote:

> How is it to browse the net with Falcon ? Isn't it slow ? Can you see

It is slow with an stock falcon. Atari cab needs double time to get one
and the same page as you get it with any other chain. E.g Mac with
Netscape. An urgend point if you had to pay phone line.

> graphics or only text ? I had 486/66mhz and it was pretty slow so I

Graphics and text.

> cannot imagine 16mhz atari falcon for web browsing or 8mhz atari st!
> Maybe Atari TT or something like GEMULATOR ?

Also you can browse web with an st and atari cab, it is much slower as
with an falcon. Fastest chance to browse with an atari here is magicMac
on power macintosh, atari cab. Doasnï¿½t test any other emulator.
(But itï¿½s slower as on mac!)

Make sure CT2 DSP patch is loadet in autofolder well.

> I have a Falcon with Centurbo II installed, and that is working pretty
> well, but any prog. that uses the DSP won't boot up.

Only a smal part of atari software use the DSP. E.g Apex, AniPlayer.

Most of DSP errors based on a missed clock. I never desolder ONE DSP in
the long time i got falcons on my table.

Check first for any software that disable DSP.
Second check DSP patch is loadet well.
Third check hardware, DSP clock signal.

From: fried@dragon.achilles.net
Message-ID: <8vrpva$e4h$1@localhost.localdomain>
Source record: 53847

Hello, I was the original poster for this question. I have Logic 2.5,
the key I use fits in the cartridge port, and has 4 extra midi outputs.
Of course it is also the dongle for the program. If I use this dongle
centurbo will not work for long. It will crash even if I don't use Logic.
If there is a way to get Centurbo to recognize the Logic dongle I would
like to hear about it.
Thank you for posting, Mark

Source record: 53848

FOR SALE

1x AB40 Falcon accelerator

Package details

- 68LC040RC33B CPU (no FPU).
- Efficient 10 deg. C/W heat-sink (cross-cut fins, large surface area), no fan.
- CPU is socketed, easy upgrade.
- Ribbon cable for connection to motherboard.
- No fitting instructions, software or technical support (up-to-date AB40 resources are on-line).

One SIMM socket slightly damaged, metal retention clips don't stay in place. Still works and is easily replaced if needed.

Price: £85.00 including registered delivery within UK mainland. Overseas enquiries please ask for further details.

6326. S/W for SCSI A4 Scanner

Newsgroup: comp.sys.atari.st
Date: 2000-11-26 00:00:00 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <8vrute$cp7$1@news5.svr.pol.co.uk>
Source record: 53849

Here in the UK I have recently seen an advert for a UMAX A4 Flatbed Scanner for 60UKP this seems quite reasonable seeing as though it has both USB ports and SCSI II. At the moment I don't have a model number - but it was advertised by jungle.com.

Two questions:

1) Will it work with my Falcon, I already have a CDROM drive connected to the SCSI port?

2) Is there any scanning software available that would work with these modern scanners (ie still supported!), what drivers do I need also?

I would appreciate any help before I purchase it!

Thanks

Neil

Actaully I think browsing with a Falcon should be faster than browsing with
a 486/66mhz.

Source record: 53853

I am happy to announce that Harry Koopman sent me a new version of MidiJoy that runs on a Falcon and TT030. It is included in the mdjoyprg.zip now on my site. He also redid the manual to reflect these changes. Here is the Link :

http://sites.netscape.net/timconrardy/midijoy.htm

For those that do not know: midijoy is an alternate "mouse" controller that was influenced by Laurie Spiegels Music Mouse program. You basically move the mouse and it creates Music to your actions . At the same time you can do stuff on the QWERTY keyboard that changes the music as well.

It is programs like this that make Atari a unique platform.

I would appreciate any comments on midijoy (as well as Harry Koopman too!)

Tim

>Verify back on and living with it.
>

Hi Thomas

I posted similar messages some months back having experienced
problems downloading files on my MSTE. They appeared to download fine
but I was unable to de-compress files without CRC errors.
It was also partially responsible for corrupting my
HD partition which led me to think my HD was the main problem.
I was trying to use faster speeds at the time but now I stick to 19200
on Modem1 which has at least given me reliable downloads - if
not as fast as I would like.

Apparantly the problem is caused during data transmission over Modem2
or Serial2, and simultaneous DMA access of the hard drive (or floppy)
when files are destroyed. Compressed files then can't be unpacked
successfuly. The problem comes from a programmable chip which can be
replaced with a debugged one. Information on how this can be achieved
can be found in the file FSER096B.LZH. But as the text is in German I am
still none the wiser on how to actually achieve the modifications myself.

There is also a little info about this in the file HSMDOC7E/SCC_X.TXT

This has been driving me mad for some time now so if anyone can provide some 'not too technical help' on how to achieve this modification pls let me know - it seems there are a few of us pulling our hair out!

No, but you can make an educated guess.

>Kevin (OL8 4DL) so where is that??

Oldham.

Oldham being the equivalent of Knoxville, in this case, and West
Yorkshire being the equivalent of Tennessee.

Although, asking someone who maintains a database for a national camera
club to identify somewhere by postcode is a bit silly, really, and the
postcode isn't the same as the 'State'. That would be like someone
asking you where '08080' is in the USA.

I'm British, by the way. You might also look at the email address for
some clues, as in @home is usually Canada, anything with .rr is
RoadRunner, which is a cable modem provider in the USA, etc.

Hi Lyndon,
Of course, Diamond Edge has a built in undelete that gives you clues
as to whether the _whole_ file is retrievable before you retore the
directory entry... but I guess that isn't much use to you now.

Was Edge part of the package you picked up?

Hi Steve,
MagxDesk allows multiple resource files too, but I think it's limited
to just 10 (in v5.11 anyway).

6352. falcon for sale

Newsgroup: comp.sys.atari.st
Date: 2000-11-26 00:00:00 UTC
From: paul_mc@atariste.freeserve.co.uk
Message-ID: <8vr4hu$og9$1@news5.svr.pol.co.uk>
Source record: 53924

Hi,

Very regrettable sale.

Atari Falcon 030
- excellent condition
- still have box and manuals
- keyclicks have been fitted

14mb Ram
310 Internal IDE Hard Drive
250 SCSI zip drive + disks
Microvitec VGA monitor

Phantom accelerator with all instructions not installed through (
phantom is a nemesis in description)

includes all leads

Magic v6
jinnee 2.01
CAB
Papyrus v4
Atari Works
Texel
NVDI v5.01

And masses of other bits and bobs, latest versions of most software

I am in Bristol UK
I have no idea of costs of shipping, but would like the machine to
stay in the UK.

Please sensible offers to paul_mc@atariste.freeserve.co.uk

Reason for sale is that I am a financially broke student, and I've
finally reached it's limits, maybe someone can fit in the phantom and
carry it on another 5yrs.

paul mac

^^^^^^^
uhm ... RTS/CTS IS hardware flow control, so I guess you mean XON/XOFF
here? Anyway, if serial ports on the MSTe (or are we talking TT here?) are
the same as on the TT, it doesn't really matter what port you use as both
Modem 2 and Serial 2 are coming from the SCC. However, if you intend to
use the LAN port later, do as suggested and stay with Modem 2. Both Modem
2 and Serial 2 support RTS/CTS. Only one of the MFP ports do not have
RTS/CTS handshaking .. I think that was Serial 1.

What total bollox!! Fix your computer then magic will run fine on it.

Magic quite often shows up hardware problems that otherwise dont surface,
if peops have problems with magic then they should look closley at their
hardware.

Its easy to blame Magic, but its not the cause, its just a distraction
from the real problem.

I have helped numerous peops with magic installations, it is rock solid
and very stable. Ive used all its version and agreed its had niggley
problems as its developed but none that cause problems youve mentioned.

The current level 6.1 is rock solid when used with HD-Driver, NVDI and
Jinnee.

>turning Write Verify back on and living with it.

I dont think the write verify switch is the problem, have you scanned
your disk for problems, you may have a duff cluster.

Serial port choice and port speed and its possible attendant errors would
not cause write verify problems, although it may still cause file
corruption it wont be at a disk level, i sugest you leave the port and
its settings as is for now and investigate your disk problems first.

Try cutting back on your system setup if possible to help trace your
problems, Scan your HD for errors

If you still have problems it'l help to list all your Auto/Acc/TSR's
software versions.

MagiC is a relatively new Operating System that
- replaces TOS / MULTITOS on Atari and clones (like Milan + Hades)
- is a preemptive multitasking system, much more stable than TOS ever was,
but less stable than Linux. As TOS was, it is intended as an OS mainly
for nonprofessional use.
- is available for MAC and PC as well. Note that on PC, an 68k processor
is emulated so that y'll be able to run your old Atari software.

From my personal experience, I can state that buying is worth while,
as long as you have enough memory on your machine: 4 megs are recommended.

Rating should be slightly less than DEM 200.- ($, EUR 100.-).

Get more info directly from the vendor (Pages in english are offered):

http://www.application-systems.de/

Tennessee, you geographically ignorant Brit. And it's in the USA - the
big continent on the other side of the Atlantic. The one without a
president.

Richard, who wouldn't be so sarcastic but feels there is a degree of
wilfull stupidity going on here.

No, the stupidity isn't the reputation of Americans... just the Florida democrats trying to prove Gore is the winner.

PAH!

If Gore wins the presidency, he will have stolen it! Bush is the rightful winner of the election. But I wonder if there's a single democrat in the US that would admit such a truth. You know it's no wonder the symbol of the Democrats is the donkey... stubborn and stupid. Elephants are much more dignified and wiser. And I think Gore and his followers are the stubbornest, stupidest donkeys in America!

Oh, I'm sorry... I thought this was:

usa.reality.algoreisanidiot

Forgot this was an Atari newsgroup.

Hey, if I can't promote some new Atari computer that will never exist, I might as well be doing something productive! :-)

Jared

Oh I wish people would put the actual country when selling stuff, TN is also
the abbreviation for Tenneriffe a beautiful holiday island just of the coast
of north Africa another country with dozens of " States"
as the world shrinks with the internet even Americans can't just assume that
everyone else knows about all their states

Kevin (OL8 4DL) so where is that??

From: ptonthat@club-internet.fr
Message-ID: <8vrleq$bd2$2@front6.grolier.fr>
Source record: 53943

Bonjour :)

Joe 1.48 is now available. Its modules (Joe's Good Tricks) is now
included in the main archive and is upgraded to Release 2.

News:
- Changes in the install (imposed folders)
- Changes in the modules management (icon in Joe' shell window,
Joe's exchange protocol changes, some unused modules are deprecated,
the others are now part of the main archive)
- External tags menus (creation and customization with a RSC editor)
- Kurzels viewer (with help of BubbleGEM)
- Bugfixes (the "first kurzel" bug is corrected)
- Double click on a tag selects it. Double click plus Shift key pressed select the "group"
tag.
- Keyboard overrun avoided (XBIOS(14) method, thanks to RGF)
- last minute upgrade : accepts files of 0 KB length created by Jinnee

you can download at http://rajah.atari.org or directly at:

http://www.multimania.com/nef/files/joe148uk.zip (~300 KB, English archive)
http://www.multimania.com/nef/files/joe148fr.zip (~300 KB, French archive)

The German archive is coming soon: the translation is in progress
(Thanks to Jens HATLAK)

Bye

> Falcon (or could I use Mac MIDI ports in the 'net' port?)

The best you can get is SoundPool's MO-4, which gives you 4 extra midi outputs via the printer port - that is, totally 80 midi channels instead of the meager 16... ;)
I've tried to use a serial port device, which had one port and used the "Export" driver, which worked fine before my Falcon days - but it didn't work at all with CAF - don't know if it works with the non-audio Cubase on the Falcon though...
The LAN-port can be used with a Mac interface, but I believe there's a problem when you boot up or something. I never tried it myself, but I've heard that it would work fine... I believe there's a text-file distributed together with the Mac-interface driver (provided with the CAF2.06 update), which describes this problem...

$150 is real price for an "original" TT in Germany and here in Austria
too. Maybe up to $200, but not more.

As I've said before, be careful! DE does not work properly with largish partitions (mine are ~840 MB) - it provides nonsense figures and I wouldn't trust it for optimising! Also, I don't think it handles LFNs.

>other partitions as LFN. Is it possible to have a C partiton in FAT16
>and all the other parttions as FAT32?

Under MagiC you can make any partition LFN compatible with VFATCONF.
Your first problem can be solved by making a standby floppy with just
your hard disk driver on it, renamed to .PRG from .SYS. You can then if
problems arise with your hard drive's booting procedure boot from floppy
by pressing CTRL+ALT. Once you run the the hard disk driver, you should
be able to access all partitions (may need to install icons on desktop
first). Even if the LFNs don't show, the abbreviations should be enough
for identing the files. Once up and running, you can replace any
corrupted files from backups or the original disks.

> the screen display.

Hello,

most older demos require RGB/TV and then messes up the screendisplay on VGA.
Older demos were never much into quitting back to desktop either. Reboot.

Some older demos are kinky about which videomode it is started from as well, a
generally good thing todo is to boot the machine "blank", eg pressing control
during bootup so all auto/acc's are skipped.

If you want to run some demos that works "cleanly", exits back to desktop. And
that like running on VGA monitors, you can try some of mine. They are also using
the FPU, so you can get proof that it works in practic and not just gembench.

http://www.dhs.nu/ under Demos, you can download "ATS (1999)" and "Dream Dimension
(1998)" as examples. There are many others as well, chose as you like.

About MagiC: It's one hell of an unstable OS. It has crashed my harddisk badly (as
in making unuseable on Atari without repairing it with fdisk on msdos (the mbr was
overwritten). And this has happened twice for me, and for other people I know as
well. So I cannot recomend MagiC at all. A much better choice is "MiNT" with N.AES
GUI. It's sold from http://www.woller.com.

Well, I did that, but before I did I tried Newsie with a DTE speed of
57600. I still had the "Write Fail" message. I disabled Write Verify and
Write Delay, and tried again, at 115200. Things were livelier, and disk
access was indeed quicker, but my copy of this week's A-ONE was corrupted
somewhere along the way. Newsie extracted it OK, but STZIP produced a
scrambled file.

I emailed Dana Jacobsen for another copy, and tonight tried to download it
again. This time I was using STinG 1.26. All else was unchanged, except
that Dana used MIME encoding this time where he used UUencoding last time.
More of the file was readable this time, but much of it still corrupted.

Something is definitely wrong here, and I don't have a clue about what it
might be. The only things I can think of to do are to change to Serial 2
and/or reduce my speed back to 19200. Or, I could always try turning Write
Verify back on and living with it.

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

Last Updated 11/25/00
- Sold Items removed

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60 - with power supply
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - External 2400 baud modem with power supply

Controllers Please make an offer
==========
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, &

software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, &
software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals,
software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, &
software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by
Motorola

Manuals & Technical Guides (software status specified) Please make an
offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Development Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without
software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Integral Solutions (without software)
- Brataccas - by Psygnosis (without software)

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye

- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

To respond to this message, please use the enclosed email address rather than your reply button. Dealer enquiries are welcome.

- Last Updated 11/25/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - 2 units left
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems

A stock TT is appreciably faster than a Falcon in practise.
I was also surprised to see how much faster a TT with a graphics card
was compared to a Nemesis'd Falcon on both screen redraws and image
processing.

>I thought all TTs sold mainstream were 32MHz ? Is this not correct?

The very original TT's were released at 16MHz 68030 with 16MHz 68881
FPU, but was quickly upgraded to a 32MHz 030 with a 68882 FPU.
I wouldn't imaging there were many of the originals in circulation...

On the subject of ICD drivers, I think they do give some bogus write failure messages. I'm pretty sure it's re-trying and succeeding, but failing to say so, else the OS would report a write failure, wouldn't it?

Wrt Serial 2 versus Modem 2, I've been interested to find a successful setup for both STinG and HSModem. Does anyone have a working version they'd like to share? I've got quite a tangle of wires at the back of my TT with the graphics card and monitor plugged in there, but if I can get a standard 115k2 instead of the 38k4 I'm working with it would be worth trying to get it connected properly.

I can't find my copy of the A-Z book which had errors in its pin-assignments for the serial ports, but I'm reasonably sure it's only RI that's not connected on pin 9 of Serial 2 compared to Modem 2.

Does this ring true (sorry... <g>)

Bet he doesn't have a tatty swiveling typists chair though! If you
swivel around fast enough you can create 2Gs worth of thrust which will
cool the case down to around -25degreesC.

Is it "HOMA" who do Scanner drivers/software? Do they still exist?

Anyone have a web address or e-mail?

Neil.

Definitely not. I've had a 486 DX2/66 myself, and I'd say it's almost as
fast as my Afterburner. E.g. a 20MHz Falcon use 15 minutes or so to render
the GEMDOS function overview (in the Atari Compendium) in CAB, while a
40MHz Afterburner use 40-50 seconds... The 486 (MSIE 4.0) used about a
minute.

I beg to differ, a TT is quite a lot faster than a stock Falcon, probably twice as fast on most things, three or four times faster on some things.

> 16MHz too.

I have one of the first TT's manufactured myself (october 1990), and it's the 16MHz version upgraded to 32MHz. I don't think many pure 16MHz TT's were sold, if any at all. All TT's are 16MHz really, it's just the CPU (and perhaps the FPU? I'm not sure) that's double-clocked. It really doesn't make much difference with a 030 since the caches are so small, but it made the ads more impressive.

The main reason why the TT is so much faster than the Falcon is that it's a true 32-bit design, and not a 16 bit design with a crippled (16 bit databus, 24 bit address bus) 030 like the Falcon.

You need a special alignment disk (NOT any
old disk) and oscilloscope. I wouldn't call it
a simple DIY job. Back in the old days it
was common, but now FDDs are throw-away
items (except, unfortunately, the Atari type
with the nice bezel - perhaps you could remove
just that bit and transplant it onto the same
mechanism if you find one...)

Opps forgot. If the drivers work It should not co-exist with a CD ROM, on
the other hand given the delay at UMAX to produce
Windows/2000 drivers for the USB scanners, which did not arrive until April,
when W2K had been available in retail for 3 months and as a beta for
goodness knows how long I guess they could screw anything up.....

Okay, so MagiC sucks. Your demos both worked under TOS, MagiC + Thing,
and exit cleanly, no problems with videomodes.

I'm impressed ;) And off to download everything else!

Richard

6407. Hades060 and EIDE help

Newsgroup: comp.sys.atari.st
Date: 2000-11-27 00:00:00 UTC
From: Lonny Pursell <fatal@SYNTAX.ERROR>
Message-ID: <Pine.MNT.4.10.10011271727080.106-100000@TT030>
Source record: 53814

For the moment I'm booting an old SCSI drive as I seem to
be having trouble getting the machine to accept an IDE
drive. Perhaps someone has some advise or had similiar
problems?

I have a brand new Quantum 15gig which always results
in a "spurious interrupt" error. The msg appears directly
after the memory test at boot time, but before HD driver even
loads.

I have an older 1gig Fujitsu which was pulled from a working
amiga setup. Booting with this drive results in a "bus error"
at the same point.

Both drives completely halt the boot stage so I never get to
the desktop. I am 100% sure they are connected correctly
and set as master during all tests. I even have printed docs
which came with the new drive so there is no guess work on
the settings or cabling.

At this point I'm baffled. Maybe the 15gig is too big or too
new? It has udma 100/ATA blah... and so on, all of which I
don't really need. The older drive perhaps needs re-initialized?
Maybe the amiga has place data where the hades looks for a boot
record?

Any help would be good... thanks.

>>and for other people I know as well. So I cannot recomend MagiC at all.

> What total bollox!! Fix your computer then magic will run fine on it.

Please tell me how to fix my Falcon to make MagiC run reliably. Even the cleanest of clean MagiC-setups will crash my Falcon, even though the *exact* same setup runs reliably on a virtually identical (same accelerator, same gfx card and the very same disk (taken from my Falcon and booted as is)) Falcon. TOS, MiNT+N.AES, Geneva and MiNT+Geneva is stable.

> Magic quite often shows up hardware problems that otherwise dont surface,

That's one theory. It's possible that MagiC access some registers too fast on the Falcon, with the result that stability depends on having the "correct" parts from the "correct" batch. I'd say that this is something the OS should take care of, it's not a hardware problem in the sense that the hardware is faulty. The fact is that hardware varies slightly from batch to batch, and especially in a fragile and delicate design like the Falcon this can make a big difference.

> if peops have problems with magic then they should look closley at their
> hardware.

No, the developer(s) of MagiC should take a closer look at the hardware.

> Its easy to blame Magic, but its not the cause, its just a distraction
> from the real problem.

I don't think so. Even if some Falcons are really defect and that's why MagiC doesn't run reliably, then MagiC should either be fixed to handle this hardware (after all, TOS, MiNT and Linux doesn't have these problems so it should be possible) or the publisher should admit that there is a problem and offer a refund.

The only reason this is for sale is because I
never fitted it (though I did give it a good soak
test yesterday on a friend's AB40 machine).

AB40s are not the sort of thing that people
sell unless together with the Falcon, because
they work very well.

This is exactly what I described as the problem in a previous
message. What is needed is someone who is willing to program the
replacement GALs for us. I could use two of them. If we can consolidate
all of our needs there may be a large enough quantitiy to make it
worthwhile for someone to do.

Why not?

Sometimes doing things differently part of the entertainment. For my part (as an example), I use my office's nice T1 line via a 100bT connection in the evenings and consequently use my Falcon at home infrequently for net access. Nonetheless, I do use it.

We'll likely never know who had the most votes, particularly since (if you eliminate S. California) the difference in the popular vote nationwide is similar to that in Florida (less than 0.1% difference). The rules in place were designed to exclude votes, not include them, and traditionally about 1% of ballots are disqualified for one reason or another. Usually this doesn't affect the outcome.

With a number of people intentionally not voting for president, another number uncertain of the rules (no, you can't vote twice) and millions of registered voters not voting at all, the only thing we can be certain of is that we seem to like (or dislike) Bush and Gore about evenly. Now, if one of them used Ataris, that would be another matter. :-)

OK......sorry about the confusion there. The Atlantis BBS address went out so now the "official " (whatever that is:-)Site is the "mirror" which is:

http://sites.netscape.net/timconrardy/index.htm

I did make an announcemnt on this newsgrp when that happened, but I still have to change my signiture "for real" as I mostly just edit out the old address. Looks like I missed one time.

I have been making some improvements on the site including an easy way to join Atari-Midi: you just put in your email address, and thats it!

Hope that clears things up. The netscape site seems pretty stable.

Tim Conrardy

You need an oscilloscope and an alignment disk (with elliptical tracks
recorded). Then you need to find the output of the first pre-amp on the
drive to attach the scope, loosen the screws on the stepper motor and adjust
for optimal signal on track 40 - check after fastening the screws again.

In short: it is much easier to just buy a new PC drive and modify that for
DS0 instead of DS1.

In French (and, on other languages), we say "Mastodonte" (pronounce it "Ma - ST - o - Don't" ^_^ indeed). And, you are right, it's a sort of enormous fossil animal which looks like a mammoth.
Moreover, "Mastodonte" can be used to describe a stout build person or a huge machine.

Well, after a lot of experimentation I've found it doesn't crash nearly as
often when I disable the loading of images - so it's probably bombing when
it runs out of memory decompressing jpegs etc. :(I've therefore done the
decent thing and ordered a ram upgrade. :) Thanks for your help.

Hello,

I'm afraid it's not bollox at all. It is exactly what has happened. And if it's my hardware, my friends hardware etc that is making the software bug, so be it. The software still crashes, while other software (read; mint/n.aes) works fine.

>I have helped numerous peops with magic installations, it is rock solid

Hello again Richard!

Definitly not software. Most demos access the hardware directly, and belive me, it will be an rgb-signal coming out of the Falcon then :-)

With hardware it is possible to translate it to VGA, but such devices are usually not that cheap. Or easy to find for that matter.

Easiest way (and most effectful) is simply to connect the Falcon to a TV via the RF-output. Especially good if you have a big telly :-)

> I've got N.AES, somewhere, not sure if I have MiNT. I'll check them out
> when I have a new HD :)

MiNT, which is the kernel (open source, freeware) is delivered together with N.AES, so sure you have it if you got N.AES.

For news and things about MiNT, http://www.freemint.de/ is a good start.

I paid ~400UKP for mine, and that was really cheap three years ago...
Anyway, if the AB is in good condition I don't think 85UKP is that
expensive. It's a rare piece of hardware, and IMO the best upgrade
(besides a graphics card) you can get for your Falcon.

>me know - it seems there are a few of us pulling our hair out!
>

I checked HSMDOC7E/SCC_X.TXT and found this:

>
>MegaSTE with MODEM2/SERIAL2 Errors
>---------------------------------
>With some MegaSTE's, during data transmission over MODEM2 or SERIAL2 and
>simultaneous DMA access of the hard drive or floppy disks, files are
>destroyed. This usually shows up when, after using - say - ZMODEM for
>receiving (or sending) archives (e.g. LZH, ZOO, ZIP) they can't be
>unpacked (error message from the packer). This error is caused by a faulty
>PAL in the control logic of the SCC. Franz Sirl has developed a GAL that
>replaces the PAL and in our experience removes the error. The listing for
>the GAL can be found in mailboxes as archive FSER096B.LZH.
>

This sounds like exactly what is happening. The only file that's given me
trouble is the only compressed file I've done anything with since trying

MODEM2. I haven't looked for the LZH file with the solution to check it out, but I'm willing to take your word about the language problem. However, I *may* have a way to help. I know of someone who might be able to translate for us. I can't say for sure yet, because I haven't asked him, but I'm reasonably sure he would do it if he can. If you could email FSER096B.LZH to me (that way I don't have to hunt it down) I'll ask him if he could do the translation.

Please remember, I make no promises.

Steve, I am afraid Anders is right.

And you can't say that it is the falcon asthe EXACT same thing happens
on the megaste. Which is NOT falcon and doesn't have DSP etc etc.
Yet it crashes very often.
Blaming on the hardware is fine, but hard to believe when the same
"faulty" hard works for days/weeks with a different OS. Don't you think
it's a little weird?

>
> Magic quite often shows up hardware problems that otherwise dont surface,
> if peops have problems with magic then they should look closley at their
> hardware.

You don't make any sense.
Hardware is to run application which run under an OS.
If same hardware and same application but different OS and one crash and
the other one doesn't. Guess what's faulty?

the gemdos fatal error, i have seen it sooo many times. As a matter of
fact!, even with magicpc I have seen the same type of crashes, fatal
gemdos error, where the only thing was to reboot, and IF lucky the FAT of
my C drive would be ok.

>
> Its easy to blame Magic, but its not the cause, its just a distraction

>
> The current level 6.1 is rock solid when used with HD-Driver, NVDI and

> Jinnee.

yup, what I used, though not jinnee as i didn't like it.

falcon, megaste, magicpc. 3 different hardware, is that luck or what that they would fail with magic but not other OS?
btw: don't tell me that it comes from the settings as magic is "supposedly" the easiest thing to setup, the user friendly OS. And I figured that if i can setup NT, MiNT with MiNTOS/kgmd, irix and linux, Magic can't be that hard to setup, right?

Btw: Yes i tried different order for the auto folder, and tried different tricks in magic.inf, and things like disabling the timeslice from the inf file to be enabled from the cpx, and all that crap. that didn't help much. And I figured that if with NO auto folder and no ACC loaded it still crashed, there can't be no software conflict. Magic is pure crap if you asked me. Prove me wrong, have a log: don't reboot for 1 week, load all the applications you have, and fill your memory up (so you get a memory exhausted), if you have a 4meg machine, reach the 4meg, then unload. Load CAB, papyrus, qed, airc, some gem games and all at the same time.

It seems that the best machine for Sequencing is the TT, the Falcon is
best for hard disc recording.

So I think I should have both :)

I've got a mint Roland EG-101 with manuals, new PSU etc. I'd like to
swap... otherwise I'll sit and wait till I have more money around,
having just bought the Falcon ;)

6432. Cubase *.IMG file printing through NVDI?

Newsgroup: comp.sys.atari.st
Date: 2000-11-27 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <IyyU5.18845$6W1.992581@news.flash.net>
Source record: 53895

Hi!

I was just wondering. I know that I can get Cubase Score to print a *.IMG file of sheet music, but is there any way of getting that file to automatically be sent through one of NVDI's printer drivers so that I don't have to be limited by Cubase's drivers? My reason: I have two printers, and the one attached to my Falcon, which is compatible with Cubase's drivers, is starting to not work well. NVDI 5 has the appropriate driver for the other printer, so if I get that, I could at least save the *.IMG file in Cubase, then print it through other software. But if there is some accesory or something that I can use to save some steps, that would be very helpful! Anyone know of an accesory or other way of having NVDI print a file automatically when saved? Thanks!

Blair Dean <aa728@freenet.carleton.ca> writes:
: The floppy on my TT030 is getting unreliable & I think it may be the
: alignment. I've heard that it isn't too difficult to DIY re-align, but need
: the instructions on how to do this. Anyone have these instructions that they
: could send me?

Surely, you are joking. It may take you almost forever, after you find
an oscilloscope and an alignment disk. There is really nothing to adjust.

An alignment disk will cost you about as much as a new disk drive from
Best Electronics. Teac parts department on Montibello Road someplace in
California is a good place to start for an alignment disk.

A better use of all that enthusiasm might be to pull that drive, and, with
a toothpick or something like it, apply a drop of light oil to the guide
rails and stepping motor shaft and nut. There is at least a slight chance
that after doing that, some misalignment might go away.

But, the most likely thing is that the spindle bearing are wearing out,
and the disk does not get up to speed fast enough. If your drive is
old enough, you can take it apart and put in about $75 USD worth of
aircraft quality bearings, and it will be wonderfully quiet after that,
but most recent disk drives do not both come apart and go back together.

LaCie is an OEM (Original Equipment Manufacturer).
It takes mechanisms and components from other
manufacturers and puts them in a case. It doesn't
make the actual components. LaCie uses mechanisms
including those from Yamaha and others.

My drive came pre-prepared - it sounds as if yours didn't. The formatting for an Atari is said to be different from that of a PC. Could that have anything to do with it?

If you boot with the SCSI can you then run HDDriver to read the IDE? Don't forget that HDDriver is not guaranteed to run with the Hades (caching of SCSI addresses or something). Nevertheless, my IDE runs with HDDriver (7.61 I think).

Perhaps, but I honestly don't know.

I do have the HD Driver version that is Ok with the hades.
My problem is I'm simply stuck. If I disconnect the SCSI
which I really don't need and place the HD Driver master disk in
the floppy, I should be all set. However, since the error
occurs after the memory test and is fatal, it halts never reaching
the desktop or booting the floppy. No matter what I do I am
forced to remove the IDE drive or the machine won't boot
at all.

I have mailed Medusa about it, since it should not halt so abruptly
at startup. Unless I got a hold of 2 fubar drives. :-)

IstGuide (a viewer for all kinds of files) can be configured to send its output to a GDOS device rather than to the screen (CTRL-A brings the config menu up). With it configured to open IMG files in your desktop you're half-way there :-)

As for automation, that depends... (MagiC, Scripter, jinnee might help?)

And let's not forget that the Falcon shares *all* of it's RAM with the
sound and video subsystem, thus slowing it down even more.

The freeware prg BGH.APP makes usualy part of Resource Master from Armin
Diedering.
You can find a demo of Resource Master on the Belgian ftp-server

ftp://chapelie.rma.ac.be/utilities/rsm320d.lzh (586.160 bytes)

It's a German version. I don't know if there is a Englsih translation.

Have you tried just booting the Hades with a floppy and then running the HDDriver program from the floppy?? If this works, maybe you could format the drive with HDDiver and partition it. It may be that your settings in HDDriver somehow conflict with the drives. Try booting the SCSI drive then run the utilities program and have a look. The best thing is to just email Uwe Seimet and see what he thinks...

Well the critical issue here is the errors occur prior to HD
Driver even loading. HD Driver is not the problem, and I am
very sure the TOS or something in the Hades is doing some
pre-test of the drives, perhaps looking for executable
boot sectors or the like? I never reach the desktop
as the errors are fatal and force me to power down.
If that helps clearify my situation. ;-)

If it weren't for the soldering, I'd probably find some way of finding
the extra cash, like selling a redundant synth (I don't use the 202
much...). You don't want some laserdiscs, by any chance? *grins*

Yes...since they became shareware, it is nice to see the "real"
versions. Runs nice on a falcon and actually looks very modern.
EXCELLENT SOFTWARE. I really like the Arpegiator as well as Charming
Chaos.

> What's the best freeware/shareware sequencer to use? I've been using
> TigerCub on the STE, which is basic but very easy to just sit down and
> use.

YES2..I would agree that Tiger cub is easy to use. However, now that
KCS Omemga is shareware , you can try it and do a comparison. In KCS,
you have OPEN mode which enables you to have 128 sequences you can
trigger from the Falcons keyboard.Neat stuff.

Also...there is now a 030 version of MidiJoy as well as a 030 version
of Tunesmith. Try those out for size. See sig.

hey! you should have tried Magic 4 on a Falcon if you wanted to see buggy! :-)
5 is an improvement, sort of. I can use to do internet stuff,
but almost no graphics software I have works reliably under magic
(Photoline, Pixart, ImageCopy, TruePaint, TrueImage, DA picture,...)
MiNT/n.aes seems much better though still problematical, probably due
to some faulty auto/acc programs which I am weeding out, plus configuration.
MiNT is more difficult because you have to understand more about how your
system works, but even 'out of the box'it works better.

What I meant was that the application crashed but not MagiC, so I could
still continue working - though usually I save anything that is still
open and reboot just to be sure! It is very rare, so I can't recall
which applications were involved. CixRead occasionally does when it
encounters what is obviously a bad Usenet message - it's own Crash
catcher alert comes up.

But I must admit I have 14 MB of memory, so have not so far used it all
up AFAIK. Even then I'd expect to get an alert rather than a crash.

Body handling: HTML body converted to readable text

Hi!

While looking through my C:\GEMSYS\HOME folder I came across some strange files, whose origin I don't know. One pair is DIR.HTM and RESULTS.HTM. The first seems to be a listing of all folders in my HTM_DOCS directory with lengths, starting:

H:/htm_docs/

./ 0 Bytes
../ 16384 Bytes
...

The second one just has:

Search results

Now I assume these are something generated by CAB, but should they be in that path, and can I delete them?

The second pair are binaries SMP.1 and SMP.8 of around 33 and 34 kB respectively. I thought these may perhaps be desktop info saved by Thing (or perhaps jinnee?) although the resolution-dependent ones are all normal readable text. SMP.1 seems to consist almost exclusively of upwards arrows (ASCII-1) and NULLS. SMP.8 starts off with various binary char groups, followed by the complete Atari character set and then mainly groups of repeated characters again in largely alphabetical order but sometimes jumping back. A typical extract is:
...
AAABBBBCCCCCCDDDDEEEEFFFFFFGGGGHHHHHIIIIIIJJJJEEEEFFFFFFGGGGG
...

After a section all in caps comes a similar section all lower case, then a portion of spaced character groups and ending in a mish-mash of repeated groups of upper-ASCII characters more or less in ascending order.

Can anyone identify these, and tell me if I need them, please?

Regards, /Peter/

Just as a matter of interest win95 has a bug that will cause it to crash
after running 32 consecutive days without being switched off, My Atari's
will never crash by themselves (I have 9 of them). But then I run SingleTOS
still, Yes I know, I know but it is ROCK SOLID. OS in rom can't be beat.

All my Falcon's are fine thank you, but I used to have a MegaSTE with faulty
cache. The only standard mod's I do to Falcon's are the timing patches,
which ATARI say you should do anyway, after that SCSI is fine and all

I don't know how to say this to get it across, but I will say
it again. Having the IDE merely connected results in a
fatal error before any thing loads from floppy or the SCSI.
Since I get different errors I suspect the motherboard is
probably ok but the drives I'm using are not compatible somehow.

It's a 4Mb Stacy with the original 52Mb Seagate. MagiC 6.x installed
without problems, but I have to use AHDI. I don't think I've done anything
special with the configuration except from turning off that awful
boot-log. And I'm using MagXdesk to save memory.

Hi Lonnie

On 28 Nov 2000 22:44:59 , JI Logan wrote:

>Don't forget that HDDriver is not guaranteed to run with the Hades
>(caching of SCSI addresses or something)

I know it may not help with your present problem, but just for the record, my Hades came supplied with HD Driver 7.54. I have never upgraded as this does everything I want and appears to behave perfectly. The only time I have a SCSI problem is with Cubase, and I have been assured this is connected to the way Cubase was written.

It would certainly be worth your while getting hold of an older version of HD Driver that is more likely to work than the recent versions.

Meanwhile, good luck with your project - I'm sure you'll get it all running soon.

Cheers

Paul

> >Hmmmmm,,,,, can anybody answer ??????
>
> Stik 2 as the internet layer and CAB. Will work from a DD.

If you set up a 2 meg ram disk, you can use that for the disk cache and
CAB becomes quite speedy with images off.

6493. Q: uniterm and the mouse

Newsgroup: comp.sys.atari.st
Date: 2000-11-29 00:00:00 UTC
From: yf110@vtn1.victoria.tc.ca
Message-ID: <3a259201@news.victoria.tc.ca>
Source record: 53706

Hello...

On various occasions I find it useful to use my old 520 ST as a terminal emulator. To do this I use an old copy of Uniterm.

I would like to get more info on using uniterm, cause it looks like it does more stuff then the online help can explain, in particular I would like to figure out how to cut and paste using the mouse.

e.g. if I do a directory listing then I would like to copy a displayed file name and then paste it onto the command line as part of the next command.

Does anyone know how to do this, and/or where to get more info on Uniterm?

> So there are no problems with these products? I didn't realise...

Ofcourse they all have problems of some sort, but not of this nature. E.g.
TOS and MiNT (which basically is the only other OS'es I have personal
experience with on the Falcon) runs equally stable on all Falcons, as long
as the Falcon works correctly. But MagiC has an unfortunate tendency to
not work reliably on Falcons that otherwise works fine.

But it can :-) The TT is a true 32-bit computer, all RAM - even "ST-RAM"
is 32 bits wide.

I found the biggest hangup was if you used the wrong Sting and cab.ovl,
plus you need to put the jpeg dsp program in the the autofolder
(djpeg.prg)

For sites like Yahoo and other sites with limited graphics and limited
banners the F030 performed wuite nicely. with lots of graphics, the
machine gets bogged down trying to decompress them all.

Comparing the F030 to my p100 laptop, they are pretty close until you
hit a graphics heavy sit, the the F030 simplys grinds to a halt.

Have you tryed holding down ctrl-alt-shift at boot to avoid booting from HDD ?
If not do that and then try to run the HDDriver from floppy.

Date: Mon, 27 Nov 2000 13:19:25 -0500

Hi Kathy,

>Magic is pure crap if you asked me.
I haven't really noticed anyone asking you anything :-)

You do realise I hope that the same can be said of MiNT? for some reason MiNT users can't get MagiC running stable and vice versa. I for example have never managed to get a stable MiNT/N.AES setup. I suppose that the hardware adapts itself automatically to his user.... you're probably transmitting the wrong aura :-)
For every user that has a problem running MagiC there's one who's perfectly happy with it and never encounters problems at all. As a contradiction this can count!!

>And you can't say that it is the falcon asthe EXACT same thing happens
>on the megaste.
What you really mean is that it happens to *your* MegaSTE, Steve happens to use a MegaSTE as well and according to his posting MagiC is rock solid and stable... I used to have a MegaSTE and MagiC ran rock solid on it also.

>Which is NOT falcon and doesn't have DSP etc etc. Yet it crashes very
>often.
I think that the MegaSTe and TT are the two most reliable computers Atari ever build. I can't really recall them crashing a lot, and if they did crash then it was mostly with programs that were not "clean" or written in the dark ages before MagiC existed.

>Blaming on the hardware is fine, but hard to believe when the same
>"faulty" hard works for days/weeks with a different OS. Don't you think
>it's a little weird?
Yes it's weird ...
I never shutdown my computers... but I really can't recall the last time MagiC crashed here, come to think of it, since I upgraded to 6.10, it never did :-/
Blaming the hardware is nonsense, I can imagine some "expanded" computers that may cause problems. Jo Even is probably right when he stated that MagiC is critical about accessing some registers. How many Falcons for example have an original Atari memory expansion fitted?

>Hardware is to run application which run under an OS.
>If same hardware and same application but different OS and one crash and
>the other one doesn't. Guess what's faulty?
Define OS please....

MagiC is a OS, AFAIK MiNT isn't since it needs TOS.

>the gemdos fatal error, i have seen it sooo many times. As a matter of
>fact!, even with magicpc I have seen the same type of crashes, fatal
>gemdos error, where the only thing was to reboot, and IF lucky the FAT of
>my C drive would be ok.
What in heavens name has the FAT of your C drive to do with this?

>falcon, megaste, magicpc. 3 different hardware, is that luck or what that
>they would fail with magic but not other OS?
I would say this is a case of being extremely unlucky or else being totally
ignorant how to setup MagiC.
You haven't told us what exactly you were trying to run... you know just as
well as I do that there are a lot of applications that don't like Magic....

>"supposedly" the easiest thing to setup, the user friendly OS. And I
>figured that if i can setup NT, MiNT with MiNTOS/kgmd, irix and linux,
>Magic can't be that hard to setup, right?
Don't be sarcastic Katherine, it doesn't suit you :-)

>if you have a 4meg machine, reach the 4meg, then unload. Load CAB, papyrus,
>qed, airc, some gem games and all at the same time.
Could you possibly enlighten us how to load all that stuff in a 4Mb machine?
Supposing that after MagiC, some stuff in the Auto folder and the desktop is
loaded one has 2.5 Mb left how are you possibly going to load that pile into
that little memory left...

Cheers from Belgium
Dennis

>to some faulty auto/acc programs which I am weeding out, plus
>configuration.
>MiNT is more difficult because you have to understand more about how your
>system works, but even 'out of the box'it works better.
So what you are saying is this :
MagiC is crap but so is MiNT, although not as much as MagiC... ROTFL!!

While you're *still* weeding out faulty auto/acc programs to get a more
reliable MiNT setup, has it occured to you that these faulty auto/acc
programs will not be really appreciated by MagiC either?
What version of MiNT are you using? it must be at least one that's three
years old since that's the age of MagiC 5.xx. The latest MagiC 6.10 performs
a lot better, just like the latest MiNT release is much better then one from
three years ago.
If you really believe that you can setup MagiC correctly without having a
clue of how your system works then surely you must believe anything. It
might be a little easier to setup then MiNT, but to get it just right you
need to put some time and effort into it. AFAIK MiNT can be configured with
only two lines in its cfg file... MagiC needs a lot more....

Cheers from Belgium
Dennis

The ST's bus runs at 8MHz, not 16. Just take a look at the RAM and ROM
chips, neither are fast enough to be accessed at 16MHz.

> The TT dosent have seperate video memory does it?

Not really, but it has TT-RAM which isn't shared with the video or
sound systems. It can only be accessed by the CPU or SCSI-controller.

Such a conflict can only happen in case you modify the HDDRIVER binary
with the "IDE Drives" option, which is usually not required. Any other
setting cannot lead to a conflict. Formatting won't resolve anything
except (depending on the drive) removing bad sectors. Unless you don't
have bad sectors formatting is nothing but a waste of time, for both
SCSI and IDE drives.

No. Formatting is *always* independent of the platform, for both IDE and
SCSI.

> Don't forget that HDDriver is not guaranteed to run with the Hades
> (caching of SCSI addresses or something). Nevertheless, my IDE runs

Looks as if the new HDDRIVER 8 also works. As for older versions I can't
guarantee this, but I already got a feedback that the new demo version
(http://home.nikocity.de/nogfradelt/hddriver_english.html) works fine
with the Hades.

6510. [PUB] 00/12 release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2000-11-29 00:00:00 UTC
From: lecoat@atari.org
Message-ID: <9033ja$t65$1@nnrp1.deja.com>
Source record: 53779

Hi all,

It's a pleasure for me to announce the december release of my software Eureka. It's a 2D Graph Describer and a 3D Modeller. It's a software that I'm writing for more than ten years, and that now becomes quite stable. It's an open software, and for instance, EB_Model & Eureka used together allow to design images that you will never see elsewhere. For a quick and good rendering, Eureka is using Open GL thanks to Dynamic Gem Library (LDG) that works well on a basic configuration of 4Mb on a Falcon. For sure, a faster Atari generate more interactivity. About the LDG, you may probably know that a 2.0 version recently came out. Eureka is using those libraries, and the result is easier and more reactive.

The software is available at : http://eureka.atari.org
Dynamic Gem Libraries are at : http://ldg.atari.org
And EB_Model indeed at : http://helijah.free.fr

Note that you will also find on Eureka homepage the famous Persistence Of Vision (POV 3.1g) that will allow you to obtain much more realistic rendering than with Open GL.

Have Fun !

See you soon for recent news of Atari front ...

no really as these magic happy people are probably using magic to type
their email with a text editor like qed or everest and that's pretty much.
I bet you can keep windows 95 up for years if only used like that too.
Things start to get messed up when the machine gets a heavy load, when
offering services, when deal with ram access. That's where you can start
seeing a difference.

what do you mean by MY megaste? are yousaying that I jinks my computers
for magic only? 3 computers all crap under magic.. I think the odds are
rather strange, especially when i know i am not the only one. but well :)
who cares I ain't using it anymore, so i can't complain.

programs not clean should crash, that is expected.. I will give you that,
however there are ways the system should handle that. The fatal gemdos
error and lock the whole thing and messing up the FAT is NOT one of them.

Ok, exactly what i was saying, faulty hardware is no sense considering
that the same hardware would work with other os.
>Jo Even is probably right when he stated that MagiC
> is critical about accessing some registers. How many Falcons for example
> have an original Atari memory expansion fitted?

my megaste is 100% original.

> >the gemdos fatal error, i have seen it sooo many times. As a matter of

> >gemdos error, where the only thing was to reboot, and IF lucky the FAT of
> >my C drive would be ok.
> What in heavens name has the FAT of your C drive to do with this?

I don't know dude, you tell MagiC. My guess is that it crashed at a moment
that it was dealing with my harddrive and shook things around. I don't
know, and don't care to know to be honest, it happened to me twice, and
the same thing happened to others. But of course we are just lying because
it is 'cool' to diss an operating system. (non-sense).

>
> >falcon, megaste, magicpc. 3 different hardware, is that luck or what that
> >they would fail with magic but not other OS?
> I would say this is a case of being extremely unlucky or else being totally
> ignorant how to setup MagiC.

unlucky, i would give you that if the same things didn't happen with 3
different machines.
ignorant on how to setup magic, please enlighten me with your knowledge,
AFAIK I have tried all the cheap tricks there are, maybe you know
something I don't. Please what is the secret?

What are your feeling about windows95 and OS/2 and such? or linux for that
matter too? I would just like to compare your experience.

> >"supposedly" the easiest thing to setup, the user friendly OS. And I
> >figured that if i can setup NT, MiNT with MiNTOS/kgmd, irix and linux,
> >Magic can't be that hard to setup, right?
> Don't be sarcastic Katherine, it doesn't suit you :-)
>

hmm Dennis, thank you for understanding the sarcasm in such a paragraph.
However I don't think you know me well enough to know what suits me or
not.

> >if you have a 4meg machine, reach the 4meg, then unload. Load CAB, papyrus,

> that little memory left...

right, so can you multitask at all then??
How can you judge the stability of a multitasking operating system if you
can't even see it multitask and see how well it performs in task switching
and memory allocation and prioritizations and all that????
This is pretty funny right there!!!
You seem to test drive pinto cars in the city (30 miles/h max) and say it
is the greatest car ever.

Hi Martin,

Thanks for your input, I managed to locate BGH on the author's web page
and with Dennis Vermiere's help, it's up and running.

Bob King.

it never
> did :-/

I have 6.00 or 6.01 on my TT. It's quite stable, way better than on my Falcon/AB, but it still does some funny things from time to time (like crashing badly when open files are deleted). It's pretty much the same on my Stacy, so I assume that it's normal. To me it feels like it can't handle unexpected situations (apps crashing, running old apps that does unacceptable things etc.) as well as it should. It's possible that some of the more obscure sanity checks has been sacrificed in favour of speed and a smaller footprint.

> Blaming the hardware is nonsense, I can imagine some "expanded"
computers
> that may cause problems. Jo Even is probably right when he stated
that MagiC
> is critical about accessing some registers. How many Falcons for
example
> have an original Atari memory expansion fitted?

That's irrelevant. As long as the RAM passes a good memory check, it works. Period. The problem is rather chips like the SCC, the DMA subsystem (SCSI, audio, floppy), the YM etc. The most obvious example of this is that MagiC crash when it access the printer port on heavily accelerated Falcons.

> >Hardware is to run application which run under an OS.
> >If same hardware and same application but different OS and one crash
and
> >the other one doesn't. Guess what's faulty?
> Define OS please....
> MagiC is a OS, AFAIK MiNT isn't since it needs TOS.

No, MiNT is an OS. It use some parts of TOS (a few (X)BIOS functions, i.e. hardware-drivers) just like MagiCMac, MagiCPC and MagiCMilan does, but that doesn't exclude it as an OS. You can even argue that MagiC needs TOS as well, since it's booted by TOS.

Anyway, that was a clever way of avoiding the actual question ;-) Would
you mind answering it?

> What in heavens name has the FAT of your C drive to do with this?

The FAT is managed by the OS, in this case MagiC, so I would assume
that a trashed FAT means that the OS hasn't done it's job properly.

> I would say this is a case of being extremely unlucky or else being
totally
> ignorant how to setup MagiC.

Isn't MagiC just wash'n go? ;-) OK, cheap point, I understand what
you're saying. MagiC can be a pig to configure properly, I've learned
this the hard way.

I actually tried it, and I was supprised ho much I could get out of
the 4mb limit. I had Cab v1.5, Newsie, Papyrus v4, Paula (playing 60k
mod) and had enough to get Gembench with 90 odd kilobytes left over.
While the mod was playing I then got Gembench to test the system. I was
really impressed that I had no crashes whatsoever. Anbd while all
that was happening, Gembench reported an average speed of 110%. Now
I'd like to see Mint/Naes do that.....

Hi!

Where can I find the most up-to-date version of 1ST-View?
I have looked for it at umich.edu and chapelie.rma.ac.be
ftp archives, but there is only an old one there (w/out
jpeg support, for example.) I tried to find it with Altavista,
but w/out any success ;(Does anybody know the URL of the
webpage 1stwiev could be downloaded from?

>with the Hades.

Yes Uwe, it seems HDdriver v8 works on the Hades. I could access all my
external scsi-devices without any problem.
I do encounter however lots of:

pid 3 (update): block_IO.c: bio_writeout: RWABS fail (ignored, returns = -13)

Is this cause by the fact that I'm using a demo?

BTW: I'm using freeMiNT 1.15.10b/N_AES 2.0.0. With my mean setup
(Mint'98 large setup) I get these warnings every few seconds. I even get
then at boottime.

>dinosaur?

OK, here it is, from the only book on paleonthology that I have at home:

Proboscidea- mammals with a snout (elephants in a sense), including:

- Barytheriidae: extinct, not well known, lived in Eocene
(70-50 mil.years ago),

- Moritheriide: extinct ancestors of all toadys elephants, lived
in Oligocene (50-35 mil.years ago), for example:
-Moeritherium

- Dinotheriide: an extinct side-branch from Miocene (35-15 mil.years
ago), had large downward-curving tusks in LOWER jaws,
for example:
-Dinotherium bavaricum
-Dinotherium giganteum

- Mastodontiide: extinct, appeared in Miocene (35-15 mil.years ago).
========== Characterized by a special shape of molar teeth
(mastodon= nipple-toothed). Also characterized by long,
straight tusks. Some of them had FOUR tusks- two in upper,
two in lower jaw. Earlier species were smaller, but later
ones were gigantic (e.g. bigger than mammoths) and with
straight tusks which were up to 3m long. For example:
- Mastodon angustidens
- Mastodon longirostris
- Mastodon arvernensis
It seems that last mastodons lived in South America,
even after men appeared (?).

- Elephantiide: elephants of today, but also include, for example:
- Elephas meridionalis: gigantic European elephant,
extinct in Pliocene
- Elephas melitensis: dwarf elephant which lived in
Sicily and rest of Mediterannean.
- Elephas primigenus: wooly mammoth.

And, generally, mastodon denotes an extremely large and massive creature, and
it is obviously a (not very funny) word play, as the word contains an -ST-,
so the authors of the site thought it should associate to Atari, though
the whole contraption >> ma-ST-o-don't << is completely meaningless.

So it is NOT a dinosaur, but, say a gigantic extinct elephant.

Which is all off-topic for this newsgroup, of course...

>the instructions on how to do this. Anyone have these instructions that they
>could send me?

The problem may be much simpler. A similar thing happens to me about
once a year and seems to be caused by buildup of oxydation on floppy
power-supply connector, which acts as a resistor that lowers the
voltage that the floppy receives. If I measure voltage on the floppy
when it starts to misbehave I find something like 4.7V (i.e. below TTL
limits), while the power supply delivers correct 5V.

When I scratch and clean the power supply connectors (from the power
supply to the motherboard and from the motherboard to the floppy)
everything is OK again for a long time.

What I would do is to boot up using the SCSI drive, then use the HDDriver ultilites program to format and partition the IDE drive. What happens if you boot up using the SCSI drive, then do an ID check with the IDE drive hooked up? Does HDDriver recognize the fact that the IDE drive is there?

Falcon's are the most shoddily-built model made by Atari - fragile is
too polite a word for it. The standard fixes seem barely to scratch
the surface, as witnessed by the fun and games encountered whenever
hardware upgrades are attempted. No-one knows in advance what is going
to break first.

>> if peops have problems with magic then they should look closley at their
>> hardware.
>No, the developer(s) of MagiC should take a closer look at the hardware.

I don't think they make any apology for the product they supply. Even
software that doesn't conform to standards they invent (MagiC
standards, if you like) are expected to be upgraded. They never made
concessions, which was one infuriating aspect of their product. If you
want the advantages of their product ten that's part of the price...

>> Its easy to blame Magic, but its not the cause, its just a distraction

So there are no problems with these products? I didn't realise...

HHHmmmmmm

Yeah I get it now. My spare STFM has had a few crankings, floppy etc, which I have used the 16Mhz from the shifter as a referance. It is a pity the TT can't use its 32bit ram for video, too.

Cross-posted from cixread.reg/feedback:

In an earlier message I said:

>I am beginning to wonder whether the comma in the 'From' field is the
>culprit.

I have now tried a (shortened) scratchpad in which I took the comma out, leaving a space. This displayed the text OK, but generated an error file on splitting and left binary rubbish at the end. This may be because I cut out only part of the original scratchpad.

LATER: I tried the whole scratchpad again, replacing the spaces in Shiuming's address with underscores, and voila! All was well. Well, reasonably so, I still got an error file, but it was not Shiuming's message (hadn't been before either).

So Shiuming, can you please do the same - take out comma and spaces and use underscores instead?

Regards, /Peter/

I actually fitted a standard 1.44 in my first MegaSTE, just milled out the
front and flush mounted the drive. It looked very nice. My brother-out-law
is a die maker, so I used his milling machine - carefully.

Yes.. and what is the main purpose of a multitasking OS such as MagiC? To crash with the application, or to clean up after the crashing application and resume? I know, MiNT is not perfect in this respect either, but it is just sooo much more stable. What applications are we talking about, btw?

Sure does. Most of the transfer rates CAB is reporting back to me are easily a good four times what they used to be. I don't spend nearly as much of my valuable web-surfing time waiting for pages to load!

>>Now I have one more problem - I think. CAB and Newsie are both hard
>>drive intensive.
>
>Drive intensive!!, scarsley bothers my system, a faint glint from the

I get a lot more than that, especially with Newsie. I tend to read both my mail and newsgroups offline, so I don't tie up my only phone line any more than I have to. There are four adults here, and I'm the only one online. They have a right to the use of the phone, too. While I'm downloading, naturally there's a lot of drive action going on.

>>While connected at that speed, my ICD HD software occasionally

>disable delayed write if its on.
>
Well, that'll get rid of the error message, anyway. I found the Write Verify section of the ICD manual, and that message is indeed from that. I also see where if I disable it, write speed should increase by about 50%. I've always had verify enabled for this Syquest 44 removable, never noticed where it was slow enough to bother before. I believe the delayed write is on, but I don't remember the length of the delay offhand.

I'll give it a shot and see what happens. I'll also install STinG 1.26. I'm still using 1.22. Might it make any difference if I use SERIAL 2 instead of MODEM 2 for my port? The STinG 1.26 doc seems to recommend it.

Hi!

Anyone know if Volker Weidner is still supporting his "Patience" game on the Atari platform? If so, I would like to register it, having rediscovered it in the depths of my floppy disk cellar.

There's no note of his email address in the docs.

Much obliged,
Charles.

6534. web surfing with my ST help

OK I know if I search for years in FAQ files I might find what I am looking for but perhaps one of you fine fellows can help me out quick. I have a quite a few Atari machines around. Mega4, 1040ST, hell even some 400
and 800's. My question is what software is there out now that will allow me to use my ST or Mega4 to surf the web as easy as I can on my shitty PC with Netscape? I use my Mega4 games and I hate my pc but
that's what I'm on-line with now. Someone tell me what I need so I can kiss the PC goodbye. Then again, is there even anything out there that makes this dream possible. Please help. Oh and while I'm thinking of it, is there anything that can link my Palm 3x to my Mega4? I'll toss my pc in the can if this can happen.

Well, you are realizing that there are NO 100% clean application.
That means that you can't run anything under magic or mint if I follow you correctly. What's the point of that? even simple GEM programs can trash magic in a big way. What is the point of running magic and NO application once again? see a static desktop? maybe a screensaver? oh no, there are no clean screensaver also...

An os must be robust enough to see that an application has failed for one reason or another.
You know, your theory is a little weird. Take a commercial multiuser OS (aix, sunos whatever). people do have access to a compiler and have real troubles trashing the OS even on purpose, when a security, buffer overflow etc technic is found it will pretty much be fixed.) Coz you HAVE to. You have 150 users logged in at the same time running some billing applications in real time, dealing with some $20 to $400,000 transaction. The system must be robust. MiNT certainly ain't there, (linux either). but it magic is a total joke as far as robustness, 1 call and boom, the whole system is totally down. Even "clean applications" will bring the system to this halt. For your information, "clean" software was used for magic when it trashed my C partition twice. WHat I call clean is: If it runs on all atari hardware I have, with singletos and mint. To me I call that application clean enough. I don't even call Calamus or Da's vector clean application (although i heard latest versions of calamus were much better, I couldn't say as I didn't try). If magic can not take what several atari hardware with singletos and/or MiNT could take, I call magic weak.

6537. Year End ATARI Sale! 10%-30% off!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To make room for new stock, Bravo Sierra Computers is holding a YearEnd
Holiday Sale. Everything is 10%-30% off! Atari Orders for $50 and up
are 10% off, Orders $100 and up are 20% off and orders $150 and up are
30% off provided the customer claims the discount in E-Mail. This Sale
covers Atari Jaguar, 8-Bit & ST. This Sale does not cover Monitors.
Customer pays Shipping. So order now while supplies last. Get your free
Atari catalogs at: www.atari.benjamin.net or E-Mail atari@benjamin.net

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Hello, my name is Benjamin Smith. I'm a Collector & Jaguar Game Player.
With all my games to play, I have no one to play Games with on my Atari
Jaguar. I live in Portland, Oregon. USA and I'm looking for Atarians to
play Jaguar Games with. You don't necessarily have to have a Jaguar.
Most any Atari will do. I'm thinking of starting Atari meetings in
Portland. Focused on Gaming but still supporting any Ataris. Call Ben
anytime at (503)256-9974 or E-Mail:

e-mail: atari@benjamin.net

If I'm unable to answer, leave a message and I'll call you back.

Just to confirm that DDP have already translated both the RSC file and the
Bubblegem for 3.20.

Once they've been checked against the full release version they will be
made available for download from the DDP website.

Note that the new version HDDRIVER 8 also seems to work. So far I only
got positive responses from Hades users trying the demo version.
Nevertheless I have to repeat: I cannot officially support the Hades due
to this machine not being fully Atari compatible. Anyway, if the new
HDDRIVER 8 works (again), that's fine of course.

Is anything decent happening on the Emulation scene at the moment? Used to be that there was stuff flying around like an arse monkey in a blender, but now? Less friction than a blowtorch and a heap of butter.

Hmm, thoughts anyone?

Capt W,

Hi Tomas,

>Do you wanna sell a TT? :)
I'am sorry. I am too attached to the old guys. And have them
both mostly in working order too. I use one with the 64 Mb RAM
and 2 gig HD for my normal work and surfing the net. The other
one is for the quite older programs which are IMHO stiil
sufficient: Xenomorph, Cybersculpt etc. who work better without
NVDI and MagiC (not quite right: Xenomorph work well). And the
last one which I bought from an geologist is still in the
configuration it was once sold. I keep it as a spare and also
as to get back to the 'old feeling'. Just for plain fun. But as
I've said: I am too attached to the old beasts. Sorry.

Raoul Teulings
3 x TT, 2 x 1040 ST, 1 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

It's the update-daemon that tries to flush the writeback cache. If
Martin turns off the cache he'll probably see a lot less of these.

6553. s/w coverdisks- offers? UK

Newsgroup: comp.sys.atari.st
Date: 2000-11-30 00:00:00 UTC
From: jim harris <shockwavejim@kerb.co.uk>
Message-ID: <905k72iek1@uranium.btinternet.com>
Source record: 53726

Hi all-

any offers/interest on the following? 2 books and about 120 disks in a lockable disk box. Some owned by me since new others come my way by the various second hand Atari's to pass through my clutches! UK postage (3-4 days delivery) is about £6.50 or collect from central Brighton.

shockwavejim@kerb.co.uk

Books

Both Data becker/Abacus Software

Atari ST Internals- Gerits, English & Bruckman
Atari ST Machine Language- Grohmann, Seidler & Slibar

Commercial Software
---

20 disks- Sorry no boxes or manuals, disks only!

Valuetime 'Lets Make Stationary & Calendars'
Valuetime 'Lets Make Signs & Banners'
Microdeal 'Mighty Mail'
The Page6 Library 'Clip Art Collection disk 1-4'
Kuma 'K-Word 2'
Mirrorsoft 'Fleet street Publisher' (3 disks)
HCS 'Memory Utilities'
Atari '1st Word'
Software bundled with Ataris (discovery pack?) numbered 1-5
1 CPM emulator v2.2
2 CPM utilities
3 Games & Utilities
4 Pictures (Degas & Neochrome)
5 DEMOS & Sample Programs

also

Atari UK Language Disk for MEGA & ST

Cover Disks
---

106 disks. This is a huge resource of Atari software new and old, demos, plenty of full versions, games, utilities, apps. The program(s) mentioned for each disk are by no means all that's on them just what is most prominent from the cover label (hence a leaning towards games). I haven't got time to check all of these obviously, but they've been looked after well and if it's a case of I've been looking for such and such for ages then I'll check.

Atari ST User (24 disks)-- Jun93 Devpac ST2,Dec93 Protext 6/Dogfight,Nov93 Prodata,Oct93 Word Writer,Sep93 STOS,Aug93 K-Graph/Bio-Hazard,Jul93 Video Master,Apr93 HiSoft C,Mar93 Mini Office/Funschool 3,Feb93,Jan93 STOS 3D,Dec92 Quantum paint2/Home Accounts 2,Nov92 MiNT/Cold Revenge,Oct92,Sep92 Midistudio,Aug92,Jul92 Escapade,Jun92 Air To Air,May92 Harlekin Utilities,Apr92,Jun92 Lotus Turbo Challenge II,Oct89,Sep89,Aug89

Misc. (2 disks)-- 'The One' Blasteroids, 'ST Action' Games Disk 15- Turrican II, Warlock, Dominion

ST/Amiga Format (10 disks)-- Jul88 No1 Oids,Aug88 No2 Power Basic,Sep88 No3 Powerdome/3D Chess,Oct88 No4 Pipepanic,Nov88 No5,Dec88 No6 Collosus Chess,May89 No11 Archipelagos,Jun89 No12 Flair Paint,Jul89 No13 Spherical (2 copies)

ST Format (46 disks)-- 1 Bloodwych,2 Bloodmoney,3 Xenon 2,5 The Untouchables/Quartet,6 Tower of Babel,7 Skate Tribe,8 GFA Raytrace,9 Conqueror/Pipemania,10 Wipeout,13 Battlemaster/GFA Draft,31 Revenge of the Mutant Camels,32 Knightmare,34 Campaign,35 Pacific Islands,36 Superboot 7,37 International Sports Challenge,38 Sensible Soccer,39,40/1 Talespin,40/2 Trip-a-tron,41/1,41/2 Protext v4.3,42/1 The Last Arcadian,42/2 KnifeST,43 Noddys playtime
44,45 Racing games,46 '3 great games',47 Legends of Valour,48 Prism Paint,49 POV,53/1 Raystart,53/2 Arabesque Pro,78 WWW Pack,79 Breakthru,80 Positive Image/Imcon1.1,81 CAB1.0,84 Bang and Blastman/Contact,85 Island Strike/ZControl/Face Value,86 Video Supreme, Bsquad, ST-Guide,?? Have you ever tried multitasking i.e. Magic/Mint/Geneva? You're
missing out. I've recently changed from tos 2.06 upto Magic 4 and
it's great (compared to TOS anyhow). TOS is solid, but the advantages
of multitasking is more important. I very rarely get a crash anyway.

Does anyone know of a URL or some hyp/txt file that shows how to set
up Magic well. I've read about the removing timeslice info from the
magx.inf file and using the cpx, but can't find it. I think it may
have been an ST Format....

Help much appreciated.

Hi Lynden,

There is:

http://ffm.junetz.de/members/jh/shh/magic.html

It's in german,the 'english language' link does not work, and it's for
Magic 6.1, but it's very comprehensive.

Bob King.

I understood from the start, but I am still thinking about it. The
only thing I could suggest is to plug the IDE when it's on. Yes I
know it's not supposed to be done, but if you have the drive powered
up then plug the connector in (straight) then it may work. I've never
had any problems plugging drives in while the computer is on, just
remember to have the drive's power connected.

Don't try it on the Hades though (worth too much, I'm sure you know
that though!), see if you can use another atari and use HDDriver
to partition to TOS/DOS or whatever takes your fancy.

I doubt HDDriver will work under emulation on a PC......

I have some double sided units, all been done up. (well, cleaned!)
About four of mine are from Acorn machines (BTW they work well) and
about 3 others are Atari one's with the front moulding.

FS: Also I have Marpet RAM expansion (no manuals, but will help with
installation) with 2*256kb simms to upgrade a 520STFM to 1040. All
working order, no bent pins. AFAIK one can put 4*1mb simms to get
full 4mb.

Medusa wrote me back and says "new" drives can be a problem.
Didn't go into any detail, and it don't explain why the
older one fails either. It was not from an Atari and
I have no means to wipe it clean here at home.

Anyway, it would be most helpful if all the Hades owners here
could possibly tell me the exact make and model of their
IDE drives? Then my intention is to find such a drive
that is known to work, and add this info to the Hades HYP
I've already started on.

Thanks for all the suggestions thus far, even though I
was unsuccessful. ;-)

The drive then shows up and the disk info is correct, but if
I try to partition then the same error occurs. The spurious one
or the bus error depending on which drive I do this with.
I've tried many times different things to get these 2 drives
to work. ;-)

With cash like it is and the Aussie dollar barely worth a rubble, it might be a while before I invest in Magic. I still play with Multitos every now and then. Now that I have Centurbo to play with I might give it another go;-)

eh eh
ST-RAM on TT is 64-bit wide !!
2 FUNNEL chips split the data into two 32 bit words !

The problem of the TT is that it is a slow 16 MHz bus !
And some times I think that some peripherals are acceded at 8 MHz !!
The ACIA is a good example : On TT, the ACIA ref are 6850, not 68B50 !!!
At 16 MHz CLK, you run the ACIA E CLK at 16/10 = 1.6 MHz !
The 6850 support only up to 1 MHz !!!
You need a 68B50 to support up to 2 MHz, what is done by the Falcon !

TT has several bad things in the hardware, and some good too...

But I prefer a F030 + CT2 !

I was looking at some of the Atari Falcon accelerators and they are more expensive than the computer itself. Weird stuff. At least if that was 300-600mhz increase maybe it would be worth buying but 30-40mhz speed increase won't even speed your computer up 100% Are there any reasonably-priced atari falcon accelerators out there ? Used ?

Shiuming Lais just sold an Afterburner for ï¿½85, I turned it down because
I just don't have the money to spend on that right now (it needs
soldering).

There should be a fast PPC based unit soon, called Tempest.

If cost is your priority, Best Buy is /that/ way ;)

If you compare the price of a new
accelerator to a second-hand computer,
yes. There have been NO Falcon
accelerators that cost more than a new
Falcon computer.

> Weird stuff. At least if that was
> 300-600mhz increase maybe it would be worth buying but 30-40mhz speed
> increase won't even speed your computer up 100%

Are you kidding? Here's a test on my CT2
Falcon, click-to-print time for a Papyrus
document:

16MHz mode: 60 seconds
50MHz mode with 32-bit fast RAM: 10 seconds

That's a bit faster than 100%!

> Are there any
> reasonably-priced atari falcon accelerators out there ? Used ?

What's reasonably-priced? You can't make
that judgement. They cost whatever it takes
to develop for a dwindling user base that is
(from experience) generally not prepared to
spend money on its hobby (people in this
group should not take offence if you know
that does not mean you; we're a minority of
the user base in here). If you want 300-600MHz
speed increase then the design will have to
use completely different chips which will
increase the cost some more, so I don't know
what is "reasonable" in your book.

Translations of the bubblegem text files, where these are loaded by the
program as pure text files. Anything that's been compiled into the program
remains in German.

Sadly, programmers seem unwilling to make English language versions of
their programs even when provided with all the translated text strings,
that's why there's no English version of Texel 2.30. Soapbox mode is now
off.

I think you're on shakey ground there Dennis, could be that MagiC copied
parts of TOS into RAM, and those parts were included in the binary that was
burnt into EPROM. Of course, once that's done TOS isn't needed any more, but
parts of it live on...

> You may remember that originally Magic was released for all machines
> except the Falcon. (Someone will remind me of the first Falcon-
> compatible Magic version). That implies there are particular issues
> with that machine.

No, the reason why MagiC wasn't Falcon-compatible until 4.0 is that
MagiC (or MagiX as I believe it was first called) was written before
the Falcon was available, so they had to implement drivers for all of
the Falcon's new hardware. And that's quite a lot.

> You may also remember the first time you installed Magic (on any
> machine). In my case, several tried and trusted utilities crashed the
> system, which was very annoying at the time. The reason was that, in
> the absence of rules that people a) knew about and b) would stick to,
> software used home-brew techniques of achieving their ends. These
were
> uncoordinated and led to conflicts that caused crashes.

Sure, but I hope everybody has learned to stay away from these by now.
And this is *not* the problem I'm talking about. On my Falcon, MagiC
will crash even if it's a 100% clean installation with only
magxboot.prg in the autofolder, no accessories and even no applications
running. I can just boot this setup (if it boots at all) and leave the
Falcon alone, and it will crash within 30 minutes. OK, so I have an
Afterburner in my Falcon, but the same setup will run perfectly on
other Afterburners. MagiC just doesn't work on my Falcon, it never has.
I even switched to MultiTOS (!) for a while until N.AES was available,
MagiC was *that* bad in 1995.

> conflicting software. Magic is not TOS. Magic is Magic. It doesn't
> claim to be TOS compatible. It claims to be Atari compatible if you
> run software that works in an allowable way.

I'm not talking about software-compatibility, but *hardware*. MagiC has
serious problems on many Falcons.

> long as you were German and could read them). This was also annoying
> to a lot of people. This is why ICD driver software - the most
popular
> in the english-speaking world - was sidelined and HDDriver picked up

No, the ICD driver was sidelined because it wasn't developed any
further. Besides, it was incompatible with all other drivers, AHDI
included.

> so rapidly IMO. Hell, even HiSoft programs didn't work without a fix

HiSoft programs didn't run because they use cascading menus when
available. MagiC didn't support these even though the AES version
indicated this (ofcourse, the correct way to check for the presence of
sub-menus is to use appl_getinfo(), but this wasn't available when the
offending HiSoft-apps was developed).

> you get corrupted FATs it ain't Magic. What's your hard disk driver

Hello? Do you know what a FAT is? If the FAT is damaged, you can't
blaim anything else than the OS (unless you're messing around with disk-
editors or optimisers without knowing what you're doing).

> had to go, but I didn't like doing it. What will the complainers have
> to dump to get a full-functioning Magic setup? It won't be pretty...

The only thing left I can dump is MagiC itself... Again, I was pointing
out that MagiC itself has problems with the hardware, incompatible
software is a whole other issue.

Anyway, as Katherine pointed out, MagiC shouldn't crash even if an
application does. One of the more important tasks of an OS is to clean
up after crashed applications, in my experience MagiC isn't very good
at this and usually crash with the famous "fatal error in GEMDOS"-
message. I'm not saying that this never happens with MiNT (e.g. if
something crash in supervisor mode, task switching can stop and MiNT
halts), but MagiC is quite extreme.

DIR.HTM is IIRC the file CAB builds to display directories. RESULTS.HTM
is the results from a search in CAB.

> Now I assume these are something generated by CAB, but should they be
in
> that path, and can I delete them?

They should be in $HOME (or in CAB's current directory if $HOME doesn't
exist), and you can safely delete them if you want.

> The second pair are binaries SMP.1 and SMP.8 of around 33 and 34 kB

These belongs to Smurf, as J. Nyberg said.

> Can anyone identify these, and tell me if I need them, please?

You can delete them if you want, but unless you're *very* short on disk-
space you should keep the Smurf files. Smurf will generate them when
needed (IIRC if it can't find them when it's loaded, it will always
generate them), but it takes a little while.

Ditto with the two CAB-files, they're generated when needed.

Hi all

Why not try a second hand Epson GT5000 or one from the same stable, built like tanks and use GTLOOK2, it's free and mostly translated (by me). See DDP Translations. Have used combo on my Falcon for 4 years, perfect.

Many advertsised in LOOT.COM

It is perfectly possible to get on to the Internet with an
Atari. Firstly, you will need a TCP/IP stack. There are several
available, but a popular one is STinG :

http://www.ettnet.se/~dlanor/sting/html/index.htm

STinG is not too difficult to setup, although you will
have to provide it with a dial-up script for your ISP.

Once you have STinG up and running you will need some internet
clients.

For web browsing, probably the most widely used program is CAB
(Crystal Atari Browser). CAB is a commecrial product, but
demo version are available for download:

http://homepages.tu-darmstadt.de/~aclauss/Atari_CAB.html

For e-mail you might want to take a look at My Mail :

http://www2.tripnet.se/~erikhall/programs/mymail.html

And, if like me, you like chatting on the WEB, take a look
at AtarIRC :

http://www.bright.net/~atari

Hope this helps.

>Please help. Oh and while I'm thinking of it,
> is there anything that can link my Palm
>3x to my Mega4? I'll toss my

Hi Bill,

No it wont work with anything other than the GT series of Epson scanners
(hence the GT in GTLOOK!!!). It was originally commercial and is now in
the PD. If you are still interseted it's at:

http://www.cix.co.uk/~derryck/html/misc.htm

ah-ha. if sysSOL has taken on Marpet, what are the odds that they would
take on Aixit.
The 14MB upgrade board that Aixit used to sell for the ST would be of
more
interest than a 4MB upgrade.

From: Katherine Ellis <kellis@fdn.com>
Date: Wed, 29 Nov 2000 09:41:25 -0500

Hi Katherine,

Oh boy.... this brings back sweet memories!! this easily beats ten postings of Jared Falvo and Sinclap put together, nothing as refreshing than a good old fashioned OS discussion :-)

>>For every user that has a problem running MagiC there's one who's
>>perfectly happy with it and never encounters problems at all. As a
>>contradiction this can count!!
>
>no really as these magic happy people are probably using magic to type
>their email with a text editor like qed or everest and that's pretty
>much.I bet you can keep windows 95 up for years if only used like that
>too.
As long as you keep insisting that MagiC users are some sort of morons who only use their Atari for things like typing a simple email or viewing some docs with QED we'll never see eye to eye. This is an attitude that simply goes beyond me... we share the same platform and if anyone dares to attack our choice we will together viciously attack him, we both even use a lot of the same programs, but still you keep insisting that there are two different Atari users, the intelligent one that has choosen for MiNT and the retarted moron that happens to use MagiC...

>Things start to get messed up when the machine gets a heavy load, when
>offering services, when deal with ram access. That's where you can start
>seeing a difference.
Not on my machine....

>what do you mean by MY megaste? are you saying that I jinks my computers
>for magic only? 3 computers all crap under magic..
I wouldn't be surprised really.... some sort of black "magic" perhaps? have you tried some cloves of garlic on top of the computers? these are known to help against this sort of thing, calling in the help of an exorcionist might do the trick as well. I'm only worried abour your Falcon and MegaSTE really, I couldn't care less about that PC....

>programs not clean should crash, that is expected.. I will give you that,
>however there are ways the system should handle that.
We seem to agree at least on one thing....

>The fatal gemdos error and lock the whole thing and messing up the FAT is
>NOT one of them.
True... however achieving something similar with MiNT/N.AES is dead easy,

it didn't actually crash, but being unable to use the mouse and keyboard leaves only one option open which is to hit the reset button. This happens frequently with programs like Calamus, Papyrus, Phoenix... strange thing is that these programs run happily under single TOS and MagiC, so why doesn't your precious OS likes them?
I know this is a cheap trick.... it's probably not MiNT that's faulty but N.AES, as a user I don't really care what the reason is, the bottomline is that these applications don't run stable on the combination MiNT/N.AES...

>I don't know dude, you tell MagiC. My guess is that it crashed at a
>moment that it was dealing with my harddrive and shook things around. I
>don't know, and don't care to know to be honest, it happened to me twice,
>and the same thing happened to others.
I suppose that in the magx.inf file there was a line telling MagiC to keep a logfile? in my experience it's not really safe to have logfiles written to the bootpartition (Newsie, Aftp... in fact everything that access the drive constantly). If you really need a logfile then tell MagiC to dump it elsewhere...

>But of course we are just lying because it is 'cool' to diss an operating
>system. (non-sense).
I don't consider anyone of you to be "lying", just overdoing it a bit ;-)

>ignorant on how to setup magic, please enlighten me with your knowledge,
>AFAIK I have tried all the cheap tricks there are, maybe you know
>something I don't. Please what is the secret?
Aha.... finally!! this is what CSAST is all about... (trying) helping each other out instead of biting each other throats:-)
Well, I'm looking foreward to receiving a magx.inf file, a full list of applications in the AUTO and START folder. NVDI, OLGA, STG and SMU inf files are most welcome as well and if you provide the NV-RAM settings and what kind of harddisk driver is used we'll sort this baby out in no time. Just mail the whole lot to my mailbox...

>What are your feeling about windows95 and OS/2 and such? or linux for
>that matter too? I would just like to compare your experience.
Brace yourself..... :-)
IMO *anyone* using the kind of shit you mention out of his/her *free* will certainly is an idiot. I don't like PC's and I don't like the OS which run on them. Except for the fact that they are cheap and that heaps of useless crappy software is written for it, no one has ever been able to convince me using these monsters.... you'll have to put two guns against my head before I toss out the Atari....
Linux? I think it sucks... especially on a PC. Come to think of it, the only OS that I ever appreciated on a PC was CPM/86 but that's a lifetime ago ofcourse.
If worse would come to worse (which eventually will happen one day) I'll jump to the Mac... anything is better then being brainwashed by the Bill Gates and Intel gang...
If your worried about my "experience", well, every single bloody day I'm forced to work on on NT driven servers and shitty Novell networks to earn

my daily bread... :-(

>hmm Dennis, thank you for understanding the sarcasm in such a paragraph.
>However I don't think you know me well enough to know what suits me or
>not.
Well... the Katherine I know doesn't really need sarcasm to underline her views, she usally usally brings these across like a bull in a China-store, remember when most of the guys here were scared to death to go into a simple discussion with you? :-)

>>Could you possibly enlighten us how to load all that stuff in a 4Mb
>>machine? Supposing that after MagiC, some stuff in the Auto folder and
>>the desktop is loaded one has 2.5 Mb left how are you possibly going to
>>load that pile in to that little memory left...
>
>right, so can you multitask at all then??
Oh yes I can....

>How can you judge the stability of a multitasking operating system if you
>can't even see it multitask and see how well it performs in task
>switching and memory allocation and prioritizations and all that????
>This is pretty funny right there!!!
It *would* be pretty funny... but then I'm not running all that stuff on a 4Mb machine either. When I bootup there's nearly 7Mb gone... which leaves 120Mb free to play with...
What is funny is how you manage to get the MiNT/N.AES/Thing combination running on a 4Mb machine. I assume you use at least NVDI as well? and then suppossedly still have enough memory free to run CAB, Papyrus, aIRC and a couple of games....
I've just checked... simply starting Papyrus with an empty page eats away 1.8Mb, CAB needs 850Kb...

What about this for stability?
-HD Driver 7.8 with folder cache of 1Mb
-NVDI with a cache of 1MB
-MagiC 6.10
-Jinnee 2.5
-ASH Scripter

While I'm typing this in Emailer I'm downloading some files with Fiffi and CAB is running in the background. Calamus is busy printing a 24Mb Pic with max memory set to 30MB, especially for you Papyrus is reformatting a 8MB textfile, Photoline is very busy rotating a 24Mb TIF, the LZH plugin from Jinnee is busy packing a partition containing 100Mb stuff, CD Player is playing a Pink Floyd CD, there are now 4 gem games running (DWBH, Skat, Newtris and Tricky),
The hilarious thing is that I still have 50Mb free... let's fire up some good old software that eats the whole available memory up at once... what about 1stWordPlus.... voila: merely 2Mb left... the processor is now taxed at 97% busy, and guess what Katherine?
IT`S STILL STABLE AND RUNNING :-)

Don't get me wrong. I'm not saying that MagiC can't crash or applications can't possibly be unstable. It all depends on what you run on it. The kind of software I run (modern programmed commercial applications) are *all* very stable under MagiC, and the OS itself is rocksolid. If I happen to come across an application that doesn't like running under MagiC, there's still good old TOS left to come to the rescue.

>You seem to test drive pinto cars in the city (30 miles/h max) and say it
>is the greatest car ever.
You've only given me a Pinto car to testdrive, next time better give me a Ferrari, before you know it Michael Shumacher is on his way out...
BTW: where I live the speedlimit in the city is 20 miles/h

Cheers from Belgium
Dennis :-)

Date: Wed, 29 Nov 2000 15:49:17 GMT

Hi Jo Even,

>> MagiC is a OS, AFAIK MiNT isn't since it needs TOS.
>
>No, MiNT is an OS. It use some parts of TOS (a few (X)BIOS functions,
>i.e. hardware-drivers) just like MagiCMac, MagiCPC and MagiCMilan does,
>but that doesn't exclude it as an OS. You can even argue that MagiC
>needs TOS as well, since it's booted by TOS.
I personally know two people who got a burned MagiC in ROM, there's no TOS
needed at all... it doesn't really matter what parts of TOS are needed by
MiNT, the simple fact that TOS is needed to run it, qualifies it as a mere
TOS-extension instead of an OS.

>Anyway, that was a clever way of avoiding the actual question ;-) Would
>you mind answering it?
Well at least I tried.... :-)

The question was:
>Hardware is to run application which run under an OS.
>If same hardware and same application but different OS and one crash
>and the other one doesn't. Guess what's faulty?
IMO nothing is faulty, MagiC is an Atari compatible OS, we both know it's
not 100% compatible... try running non-Gem games or some MIDI applications
and you'll know what I mean. Applications that are written with MagiC in
mind, I'm not saying *MagiC-only*, should behave normal though. The problem
is when someone states that applications crash under MagiC then they always
conveniently forget to mention exactly what applications....
I consider MagiC to be grown up since version 5.xx, so anything older then
four years that runs on it should be considered a success. In practice a
lot of ten year old applications run happily on it, people are always
complaining about the stuff that doesn't run ...
Funny enough this is mostly stuff that behaves strange under TOS and
probably MiNT also. I got some applications here that require minimum TOS
1.04, but I've also got some that only work with TOS 1.0 and 1.02. I wonder
how these will behave under the latest MiNT/N.AES...
It's always assumed that the OS is faulty when a application crashes, well
IMO it's just the opposite. When Calamus SL crashes under MiNT/N.AES and
brings the whole lot down should I say that it's the fault of Calamus or
that the OS stinks?
Another thing to consider is that a lot of older applications were not
really made with multitasking in mind, causing both in MiNT/N.AES and MagiC
weird things to happen. After using MagiC for all these years I've got a

pretty good idea what runs stable and what causes it to crash...
With recent written commercial software (1997 and later) you'll have a hell of a job trying to bring down the OS. Using older software is not really recommended. I've got mixed feelings about the PD/Shareware software, some are excellent but some are real pigs. It's up to the user to determine what runs stable and what is causing havoc...
If the docs don't specificly state that the software runs under MagiC I'm always cautious... nobody ever said that MagiC is the big solution, if a certain application doesn't like MagiC and I still need to run it, then I simply revert back to good old TOS... luckily I don't have to do that very often :-)

I`ve written this before: the minute that some ground breaking MINT-only applications appear I'll switch. But for the moment I'm a very happy MagiC user and really can't see any need to start using MiNT. ATM using MagiC is even in my advantage since most of them are written to make full advantage of some of it's features. The applications that are on my wish-list don't exist (yet) for either MagiC or MiNT :-(

Cheers from Belgium
Dennis

Hi,

>I have just bought a TEAC CD-R55S and I tried it with CDlab, but I
>couldn't open the CDlab after installing the burner with HDdriver. Do some
>of you know what the problem is?
Make sure that the option "SCSI generic driver" in the "advanced options"
menu of HDDriver is activated, otherwise CDLAB will not function correctly.
If that doesn't help, get in touch with the programmer, you'll find him to
be a very helpfull person.... mailto:zerkman@atari.org

What exactly do you mean with "couldn't open CDlab"? do you mean that it's
not possible to start the program or simply that it doesn't recognise your
writer?

Cheers from Belgium

I've found an Apple PowerCD CD-ROM drive, and would like to get it to work on my ST rig. However, it uses a wall-wart power supply which I don't have. From looking at the users' guide from Apple's site, the 7-11VDC @1.2A spec isn't too far away from this Jaguar wall-wart I've got. However, I don't have a clue as to whether the connector should be inside-positive, outside negative, or vice-versa. Before I take a 50% chance at smoking this thing, I figured it wouldn't hurt to see if anyone else here has such a beast and can tell me.

I think those people are extremely careless,
stupid, even. Why connect something if you
don't know what it does?

Don't cut it off, you can use it to power a
5V LED (blue, of course).

Yes indeed, Calamus SL2000 R4 runs much better. I hardly have a crash
now. There are still some strange things but afaik Invers is working on
it.

First check the polarity from the Jag PSU (I can't remeber what mine
was, sold it years ago and regret it). Use a multimeter.

Then open up the CDRom and look inside at the board, as it may say
what pins are what or check inside to see which pins of the supply
decoupling capacitor is connected to the power socket.

Email me if you need help.

Hi Jo,
You may remember that originally Magic was released for all machines except the Falcon. (Someone will remind me of the first Falcon-compatible Magic version). That implies there are particular issues with that machine.

You may also remember the first time you installed Magic (on any machine). In my case, several tried and trusted utilities crashed the system, which was very annoying at the time. The reason was that, in the absence of rules that people a) knew about and b) would stick to, software used home-brew techniques of achieving their ends. These were uncoordinated and led to conflicts that caused crashes.

The same thing happened when the STe came out and again with TOS 2.06. Were those OS's buggy? No - it was the software. Look what STOS did!

Similarly, what was the response of 2B? Nothing. They said upgrade the conflicting software. Magic is not TOS. Magic is Magic. It doesn't claim to be TOS compatible. It claims to be Atari compatible if you run software that works in an allowable way.

What does allowable mean? 2B created their own conventions or adopted those that they agreed with and made that available to programmers (as long as you were German and could read them). This was also annoying to a lot of people. This is why ICD driver software - the most popular in the english-speaking world - was sidelined and HDDriver picked up so rapidly IMO. Hell, even HiSoft programs didn't work without a fix and there are lots of noises about running Edge!

What annoyed even more people was that Magic's version of multitasking sometimes flatly contradicted the tentative standards people thought were created with MinT/MultiTOS. Why? Magic isn't MinT. It's Magic.

No-one's going to tell me that they can run everything under MinT that they could under plain vanilla TOS. It's simply untrue. MinT barely ran on its own for a long while! In the same way, you have to tailor your software if you want to run Magic, just like any other OS replacement.

So, Steve S is basically right. If you get problems with programs like Photoline and Magic, the problem definitely ain't either of them. If you get corrupted FATs it ain't Magic. What's your hard disk driver and version? What Auto programs, acc's and CPX's do you run? What are you multitasking with? I bet a list of programs that are running concurrently will very quickly lead to a chorus of finger-pointing at the offending app.

Isn't this why boot-managers exist?! (I know they aren't especially compatible with Magic - after all, which manager was written since Magic came out!)

For my part, the only reason I ever dumped Quick STe for NVDI was because I got a graphics card. Quick STe was miles faster for my purposes and blitzed NVDI for speed, but it was a "dirty" program. It had to go, but I didn't like doing it. What will the complainers have to dump to get a full-functioning Magic setup? It won't be pretty...

Hi Grzegorz,
I think 1st View became 1st Guide - is it the one by Guido Vollbeding?

If so, you'll find it at:

http://www.esc.de/homes/guivol/

I think the last version is dated 09/04/98 and it now loads JPG, MPG,
PNG, RSC and AVR among others. A very useful program - clean and
simple.

What version do you have? Toward the end there were lots of minor updates and it could easily be that you've just picked up an update archive rather than the full package.

I may have something stashed away on some old floppies...

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

Last Updated 11/30/00
- Sold Items removed

I have the following Atari ST/TT books and technical guides for sale. All are in goo to mint condition, if you have any questions in regards to unit condition, please feel free to ask.
Please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Development Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)

- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Integral Solutions (without software)
- Brataccas - by Psygnosis (without software)

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

Take it apart, and look for an electrolytic capacitor on the circuit
board. Find the negative end, usually marked with a stripe. Trace the
copper track that it's connected to back to the power connector.
Problem solved :-)

Yes it is. You can also filter out banners with a CAB plugin module. A hard drive does things faster as well, all the temp Internet files shold be stored somewhere. The lack of Java and Javascript makes things faster.

I never managed to use a RAM-disk for the temp files. The CAB displays the HTML-source when reading from a RAM disk.

Hi

If you format a double density disk on a pc, the Atari will/should be
able to read and write to it.

Failing that you can use a program like DC format 3, to do the biz to
the disk.. This can be found on my LaST PD web site:

Hi,

use PC formatted disks. Normally the PC won't have problems with it,
neither will the Atari. Atari formatted disks may have problems in
PC's.
The other way is setting up a comms/terminal program on the Atari,
plus Hyperterminal on the PC and link them thru' a zero-modem cable.
Using Z-modem transfers are limited to 19k2 but that's good enough for
occasional file transfers.
I do it on my TT using MagiC, Storm and VFAT partitions. Files like
"mintnet1.84beta.tar.gz" will go fine.

I still think the problem lies in the fact that the new IDE drives I have seen come with only 1 or 2 partitions. This means that the partitions are over 1 gig. My wife's partitions C on her PC is 4 gig. To my knowledge an Atari computer cannot read a partition over 1 gig. This fact might cause the problem Lonny is seeing and that if he can re-partition the drive into partitions of 1 gig or less, the drive should work.

Source record: 53618

Hi,

I'm having trouble booting with external harddiskdrivers on my CT2.. I have tried CBHD and a demo of HDDriver, as well as the external version of Cecile.When I select "external" in the setup, nothing happens in turbo mode (Tos 4 and TOS 7.x). It says something like "no bootable partition found" or similar. If i boot in standard mode, it finds the driver and boots up. I really would like to use another driver as Cecile does not have support for XHDI, and all filesystems in MiNT needs XHDI..

Also, does anyone know where to find a decent Linux kernel that works with the CT2?

If anyone knows how to fix this, please reply. I have asked mr. Czuba several times and he does not give me a clear answer.

Regards

/Peter Persson

From: John Cummins <cummins.at@mmcable.dot.com>
Message-ID: <oEaW5.12457$EA6.1085269@typhoon.kc.rr.com>
Source record: 53620

2 things to be aware of:

SCSI ID number
Termination

If your drive is working well now, then termination is probably OK, and will stay that way if
the existing items are kept in order at the end of the chain and the CD-Burner is installed close to the host adapter. Termination is a resistor load at the end of the chain that keeps signals from bouncing off the end of the SCSI cable and "ringing" like a bell... destroying the clean data signal. It is sometimes built into a drive and enabled/disabled via jumpers or just removed if not needed. Sometimes it's a separate item on the end of the SCSI cable.

The ID number of your CD-Burner should be unique on the chain. In PC systems the Host is usually id 7 (highest priority) with 6 down to 0 following in priority. This is usually set with 3 jumpers on the device (no jumpers = 0, all jumpers =7, etc.) and if two devices have the same ID, you need to change one. You'd be safe with the HD as id 2 and the burner as id 1 if you don't plan on adding any other items. HD as id 6 and CD-ROM as ID 5 would probably be best.

good luck.

An Afterburner at 32MHz is ~8 times faster than a stock Falcon, @40MHz
it's 10 times faster (average figures). If you're lucky you might find
second-hand Afterburners, but expect to pay atleast $200-300 for it.

This is a really stupid argument which nobody can win... Using this logic
then you can't call *any* OS that runs on a PC a proper OS, because all of
them depends on the BIOS and third-party code (drivers). So let's do that.

>>Hardware is to run application which run under an OS.
>>If same hardware and same application but different OS and one crash
>>and the other one doesn't. Guess what's faulty?
> IMO nothing is faulty, MagiC is an Atari compatible OS, we both know it's
> not 100% compatible... try running non-Gem games or some MIDI applications

I think Katherine was talking about the *OS* crashing, not applications.

> It's always assumed that the OS is faulty when a application crashes, well
> IMO it's just the opposite. When Calamus SL crashes under MiNT/N.AES and

You're 100% correct, if an application crash it's almost always the apps
own fault. But when the OS crash, the OS is always guilty, atleast partly.
Even if it crash because an app does illegal stuff, you can't blame the
application for crashing the OS. An OS should take care of this, period.

Like I've said in atleast two other messages in this thread, I'm *not*
saying that other OS'es (i.e. MiNT or TOS) never crash - far from it - but
MagiC is by far the worst OS in this respect. When it comes to cleaning up
after dirty applications it can't match MiNT (I haven't used TOS for
anything the last five years, so I've forgotten how it performs), this is
clearly a weak point in MagiC.

> brings the whole lot down should I say that it's the fault of Calamus or
> that the OS stinks?

See above. The OS doesn't stink, but it shouldn't crash.

Due to the way TOS is designed, it's not easy to make the OS as stable as
e.g. BSD or Linux. The main problem is the AES, as it allows applications
to run their own code in the context of the AES (userdefs). A bug in a
userdef can easily crash the AES, and this is *always* fatal under MagiC.
N.AES is surprisingly good at dealing with this, I've done a lot of
strange things in userdefs without crashing the AES. It has it's limits
though, and if you know what to do it's extremly easy to crash N.AES or
atleast lock it up. Stack overflows in a userdefs is a pretty reliable way

of crashing N.AES, atleast older versions (haven't done userdefs in a
couple of years now).

However, it's not usual to crash MiNT this way, e.g. even if N.AES crash
or locks up the kernel is still running, flushing the writeback cache at
regular intervals. If you have network access to the computer, or perhaps
virtual consoles, it's even possible to log on and kill N.AES, thus
shutting down MiNT cleanly. If you're lucky you can even kill the locked
or crashed application and resurrect the AES.

This is only speculations, but it's possible that the AES and GEMDOS in
MagiC depends on each other, and that a crashed AES takes down GEMDOS as
well instead of letting the GEMDOS shut down properly.

Btw. the easiest way to crash MiNT is to use software that crash while
accessing hardware directly. This is almost always done in supervisor
mode, and MiNT seems to have problems dealing with such crashes.

> With recent written commercial software (1997 and later) you'll have a hell
> of a job trying to bring down the OS. Using older software is not really

Nah, try CAB, any version. It's unstable under N.AES, and it's unstable
under MagiC. It's quite usual that it locks my TT if I try to launch any
of it's modules (like cabdload).

Linux itself is quite efficient on a 486, but X is horrible. I can't
recommend using X at all, regardless of how powerfull the hardware is, X
will still be slow, unstable and virtually unusable. It doesn't help
running Netscape either, it's a huge, bloated beast that performs poorly
in every aspect.

Windows95 is - as you point out - the best OS on a 486 as long as you have
atleast 16Mb. If you have less, 3.11 and Opera would be better.

> or what so ever.

The 24 bit address bus only limits the amount of memory you can use (14Mb
max), but the 16 bit data bus is what makes your 20/40MHz Falcon 30-50%
slower than my stock TT. Ofcourse, the DSP is very nice, the Videl is a
lot better than the TT's graphics chip, the Falcon has great sound etc.,
but without a CT2, Mighty Sonic or Afterburner it can never match the TT
for raw CPU power.

// IMO nothing is faulty, MagiC is an Atari compatible OS, we both know it's
// not 100% compatible... try running non-Gem games or some MIDI applications
.... <snip>....
// lot of ten year old applications run happily on it, people are always
// complaining about the stuff that doesn't run ...

okay, here are some defniate examples....
i haven't upgraded from v5, but a gent told me he has the same
problem on mgx v6:

Lattice C runs fine until you compile and it tells you screwed up. The
first time it reports a syntax err, mgx (& the whole world) stops.

Now, I prefer to use Everest as my editor (QEDfans: what makes QED
better?), rather than the LC editor, but I don't want to quit LC to edit,
quit Everest to compile. (&c, &c, &c) As matter of fact, since I had
been told that mgx6 still fatally died when LC found a syntax error, I
have never bothered to upgrade.

I can also give you an example of propagation: there is a program (I have
always thought it a modem prg, methinks connect) which under TOS is real
nice, it releases whatever systems it took over once it quits. Under mgx,
this prg -doesn't- unhook (or mgx doesn't let it unhook), so that when I
go to bal;ance my checkbook with phasar (yes, it must run TOS-only, and
although I wish it would start in a console-window, in the way that dos
programs do under w95-w2k...) I get a mgx error dialog asking me to
'continue' & 'tolerate'. (don't ask me the difference, cos I dont
know) Either way, to make the machine usable, it's time to find the reset
button.

// It's always assumed that the OS is faulty when a application crashes, well
// IMO it's just the opposite. When Calamus SL crashes under MiNT/N.AES and
// brings the whole lot down should I say that it's the fault of Calamus or
// that the OS stinks?

OS-OS-OS-OS-OS-OS-OS-OS-OS! <grin>
But seriously, if the OS isn't really keeping the prgs isolated (a la the
unix process-forking), NOW where does the fault lie? Ie., Why should I
write my programs attempting to guess what the user has? --what the user
is running? Being nice is good, but the OS is meant to keep the user-prg
from taking over like kudzu, no? --define the boundaries?

```
// If the docs don't specificly state that the software runs under MagiC I'm
// always cautious... nobody ever said that MagiC is the big solution, if a
// certain application doesn't like MagiC and I still need to run it, then I
// simply revert back to good old TOS... luckily I don't have to do that very
// often :-)
//
hrm. I do.

Peter, both have been saved by CAB. You may have asked for a directory list and a local search. Have a look at them in CAB and, if they don't reveal information useful to you, just delete them. They're not needed for running CAB.

>The second pair are binaries SMP.1 and SMP.8 of around 33 and 34 kB

I've no idea what these are, so no advice from me :)

6647. Ultimate Virus Killer 2000 (Atari ST/TT/Falcon virus killer)

Newsgroup: comp.sys.atari.st
Date: 2000-12-02 00:00:00 UTC
From: Richard Karsmakers <richard@fortysecond.net>
Message-ID: <3cti2tgeh1tc6q32aqgo63jqemgr5ab8q4@4ax.com>
Source record: 53632
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com (this is a new URL!).
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

It does in principle, but is not sufficiently
accurate for practical use. Also, anything
which writes direct to the MIDI hardware
on a real Atari will fall over on Steem.
Apart from that it's a great emulator and
shows a lot of potential.

Found this page mentioned in AutoCAD's support group. Checked it out and was surprised to find the program is available for lots of computer OS's, including 2 versions for the Atari, a 68000 and a 68020 versions. I don't know anything about it, but it looks interesting in that it claims to support over 200 formats, and the Atari version has the latest version number posted.

http://perso.wanadoo.fr/pierre.g/index.html

Ought to be of interest to someone here besides me. I won't be checking it out for a while tho', no time.

Today for $300 you can buy Athlon 1Ghz CPU (way faster than G4) +
motherboard
(on auction) plus you can overclock it to 1.2 Ghz or more. Weird isn't it ?
I think that
Atari TOS is an exceptional OS not like those mamooth Mac or Pc OS.

IMPORTANT NEWS!!!!!!!!!!!!!!
When one is dealing with the U.S. Military, for using a facility for any type of event, the fact that a priority function. i.e. a drill, may come and take the time of your own event.

That is true here too. My unit, B Co. 112th Engineers, did originally plan to have it's AT(Annual Training) from the 2nd of June 2001 till the 16th of June 2001. That is no longer. The AT was pushed back to the 19th of May till the 2nd of June, 2001.

As a result, with the original AT dates, no June drill was needed. But now, one is, and that drill falls on the 23 - 24th of June. As such, we have had to re-schedule the CCAG 2001 from the 29th till the 30th of June 2001, one week later.

We apologize for this change of events, as I only heard of it on Wednesday myself, and the Command to change the drill date was only a few days before that. So, this is not at all something I knew about for several months. But, only found out about it when I got my unit's newsletter.

If any of our attendees cannot attend now, because of the date change, please contact us immediately, and we will change the list. Otherwise, may all of you have a wonderful and safe Christmas Season, and we'll see you at the CCAG!

Regards,

CCAG Staff

Hallo Peter!

PP>It says something like "no bootable partition found" or similar.

SCSI-hard disk? Then you should wait until the memory test is finished (at least 20 megs or the like) before proceeding to the hard disk driver. Otherwise, the disk might still be in a "reset" state and not responding. I'm using HDDRIVER 7.8 with my CT2A Falcon, and it works well if I give it the time. So, try to enable the memory test in the CT2 BIOS and wait.

PixArt (at least the latest version) works VERY well under MagiC. I like this program a lot. It supports GDPS scanner drivers and pressure sensitive Wacom tablets.

You can get an English version from 16/32 in the UK.

FWIW Nick Harlow at 16/32 was supposed to have taken on distribution of those boards in the UK. He collared me at an Atari show to ask my advice, following my review of said board in Atari Computing.

The STFM with this board and 8Mb of RAM (SIMM) is still for sale if anyone in the UK is interested BTW.

Misconception time :-)

Despite the misleading title, the DIAL.SCR file serves to set
variables for the Internet session only. For most ISPs the section in
this file that starts "Dial script" can be left blank...

So you just need to plug in the phone number, hostname, username and
password in most cases.

Actually, I'm hoping someone with a PowerCD with a wall-wart supply
will do exactly this for me :-)

>Then open up the CDRom and look inside at the board, as it may say
>what pins are what or check inside to see which pins of the supply
>decoupling capacitor is connected to the power socket.

Actually, I did this already, hoping for an easy solution. There
are no obvious electrolytics present, everything is surface-mount
and totally unmarked. I was also thinking I could determine which
contact of the connector went to ground, but neither one does; it
runs to the input of what I take is a switching power converter.
Finally, I was hoping that one contact of the power connector would
run to one side of the battery compartment, but it appears Apple put
some automatic circuitry to switch out the batteries if an external
supply is connected. So I struck out three times.

These files are created by Smurf. They holds the NCT info (whatever this
may be). If you throw them away you'll notice that with the next start of
Smurf the program will complain and will create another one.

Of course.

> The 030
> is still more than fast enough to feed the FPU with data.

It will also be getting the answers back
in half the time, so obviously that will
enable the CPU to send more data to
be processed, but only at the expense
of other tasks. If the rest of the system
is proportionally accelerated as I
originally said, then no such problem
would exist. If you're doing nothing
but FPU operations then I suppose it
wouldn't matter.

Not quite. The FPU and CPU doesn't work in parallell - the CPU is doing nothing while the FPU does it's work. So if the FPU does it's job twice as fast, the CPU spends less time doing nothing.

> is proportionally accelerated as I
> originally said, then no such problem
> would exist. If you're doing nothing
> but FPU operations then I suppose it
> wouldn't matter.

See above. You can try a FPU-test like Nembench. If you double the FPU's clock, you'll double it's speed. It doesn't depend on the rest of the system, only the CPU. I'd rather have a fast CPU than a fast FPU though, but if you use the FPU a bit (e.g. for raytracing and similar time-consuming tasks) it's definitely worth speeding up the FPU, especially since it's so easy. Really FPU-intensive tasks will benefit more from an accelerated FPU than an accelerated CPU and bus. But doing both is better ;-)

On that basis it would be hard to recommend Linux at all wouldn't it?
Without a GUI you might as well use DOS6.22 with a DOS based browser which
work quite well on even ancient hardware. (Arachne comes to mind, full
graphical browser with mail support that works on even a 512K XT and with
any graphics card, Hercules,CGA, EGA,(S)VGA but not MDA ;-)

>Windows95 is - as you point out - the best OS on a 486 as long as you have

For sure, Opera is quite good on older hardware.

Hi

I need to find a program for an STe that will output hi-quality (well OK so it's not /that/ hi) samples that are triggered by midi from another STe. I've been trying Protracker, but it only works for Midi channel 1 (AFAIK) so that is no good. I need 4 channels to work, and I'm looking for 50khz/8bit on each channel.

You see I was thinking about getting a Yamaha SU-10, then I checked out it's specs and realised my STe could do a lot better job. Hmm, 384k of sample memory.... :)

Maybe I should get a /real/ sampler....

Source record: 53567
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Sorry for late response.

I was hoping that I will be able to draw a nice schematics, but I'm in a hurry and already late with response to your letter for a few days.

So, instead of having schematics, you will have to settle with handwaving description for the present.
ST's shifter has nine colour outputs (3 for R,G and B output respectively) on pins 21-29 and monochrome output on pin 30. This means that each main colour can be output in one of 8 intensities/-from 0 to maximum.
Colour signals are grouped per colour, so pins 21-23 are for red, 24-26 are for green and 27-29 are for blue component. D/A conversion is performed with nearby resistors. If you look closely, you will notice that
3 resistor values are repeated 3 times. There are 3K6, 7K5 and 15 K resistors for each colour. Each resistor is connected with one end to corresponding TTL output and other end is tied to other ends from other resistors in the group. Common connection of all three resistors go to the katode of small signal diode and then to th base of buffer transistor. All resistors have to be taken out from PCB and soldered to pins directly with other end of all resistors connected. Diode is soldered to common pont of all resistors and anode is wired to base of coresponding transistor.
In essence, this reflects vconnsections in PCB with the difference that all circuitry is now far away from noisy data lines. Oh, yes, one have to cut connection on the base of buffer transistor in the PCB, since this would otherwise still inject noise in the signal.

Whole operation would be to use small piece of test PCB, solder in 2 groups of 20 pins so that whole PCB can be inserted into old shifter socket and shifter chip should be soldered on that test PCB adjacently.
Then, one should connect all pins between shifter chip and socket, except pins 21-30. After that, one needs to solder on the test PCB three 74HCT32 (quad OR gates each). Two of the gates should buffer mono out signal of the shifter (pin30). THen, each colour output from shifter should be ORed with bufered mono output and connected to corresponding socket pin. Mono out pin on the socket should have separately buffered mono out from shifter. After that, one has to properly connect VCC and GND for each 74HCT32 and 100nf multilayer capacitor across power pins of each chip. Then, test PCB can be inserted in the old shifter socket. Now we have colour output active in all three resolutions.
After that all we have to do is to relocate those resistors to some safer place, possibly on the test PCB along with shifter chip and those 3 TTLs.
I'll document everything more thoroughly if needed....

Regards,

Branko

Total crap!!.

No it wouldnt have!!.

Suppose for instance you have an optimised SCSI access routine and the timing changes as the host machine warms up, is it the fault of the routine, which absolutely needs atomic timing, that then fails to talk to your SCSI device, or worse, or the hardware whose timing is drifting.

I had a hardware problem in the early days of my PAK upgrade which only manifested itself with HDDriver in use, fixing the machine cured the HD-Driver problem.

No, there are no special problems. Windows (like any of today's operating systems) provides a low level layer for accessing SCSI and IDE peripherals. You have to ensure, however, that you don't use Windows and MagiCPC/SCSIDRV/HDDRIVER for accessing the same partition. Windows won't recognize any change HDDRIVER did to a TOS/Windows compatible FAT/FAT32 partition and vice versa. So if you write to the same partitions using Windows and using HDDRIVER you will most likely destroy data. This is why for the installation under MagiCPC the default setting for HDDRIVER is *not* to recognize DOS/Windows compatible partitions.

That depends on whether this hardware-problem is specific to one
particular machine (i.e. the computer in question is broken), or if it's
caused by the design and varying tolerances of it's components. If it's a
broken computer, then it's the hardware's fault, if it's a general
feature, the software must deal with it. In the case of MagiC and Falcons
I strongly suspect that MagiC just isn't properly tested with Falcons.

OK, the Falcon is poorly designed and probably suffers from this, and it
most likely makes it difficult to write super-optimized hardware drivers
for it. Perhaps a tiny bit of speed should be sacrificed to improve
stability on more Falcons.

Hi,
That's an old bug that's well known (and one of the ones that Atari never fixed...) - you have to restart the machine and there's no other solution :(

Best regards,

Sure, but I think the 68030 in the TT was covered in v3 and I know the
Falcon was out at that time. I know there's more to it than just the
processor, but still...

So it works perfectly for some people, but not for you and that's the
fault of the OS? That really is pretty imaginative. With just Magxboot
installed the software takes it on itself to crash a machine just by
existing? It's not possible that it's something to do with either the
installation of the AB or the build quality of the machine? Maybe a
heat-related problem?

You need to have your machine overhauled. Make an appointment today.

>> conflicting software. Magic is not TOS. Magic is Magic. It doesn't

> I'm not talking about software-compatibility, but *hardware*. MagiC
> has serious problems on many Falcons.

Let's be brutally honest. We remember how the Falcon was virtually abandoned before it was released. The machines weren't built - they were thrown together! It's not a machine I would entertain tbh. There's more support for the dodgy machien theory than a dodgy OS here.

>> long as you were German and could read them). This was also annoying

> further. Besides, it was incompatible with all other drivers, AHDI
> included.

ICD was upgraded to be AHDI compatible later on because it was recognised to be out of date with the thinking that Magic supported. So, was the OS buggy when the driver didn't work at the outset. No. The driver had to be updated to support the protocols that Magic supported.

>> Hell, even HiSoft programs didn't work without a fix

> offending HiSoft-apps was developed).

Yes. HiSoft support had ended at that time so they weren't updated, but that'sanother example of a home-brew solution in the absence of a standardised method. XMEN_MGR was made available, but wasn't included in the Magic because it was only needed by certain programs and they didn't want to build in backward compatibility. It's one of the few concessions 2B made.

>> you get corrupted FATs it ain't Magic. What's your hard disk driver

Am I missing something, or doesn't Magic work through the hard disk driver?

> The only thing left I can dump is MagiC itself... Again, I was pointing

Of course, I agree crashes need to be contained. I'm not quite sure how you protect crashed apps crashing the system, but today at work I was reading some Email in Novell Groupwise and the dreaded blue lurgy descended onto my screen bringing Windows to a grinding halt. It's hardly a unique problem in MT environments and even the biggest software vendors can't trap everything. What's new...

> programs can trash magic in a big way.

Yes, it's often the simple ones that are the worst. There needs to be
some degree of sophistication - even if it's just to support the OS it
wants to run on.

> What is the point of running magic and NO application once again?
> see a static desktop? Maybe a screensaver? Oh no, there are no
> clean screensaver also...

The fact there are no clean screensavers is beside the point, but I
certainly wouldn't run anything that conflicted with my OS of choice -
whether application or background utility...

> An os must be robust enough to see that an application has failed
> for one reason or another.

Obviously true, but as I just said to Jo I can't rely on Novell and
Windows to work together. I never run any part of SmartSuite unless I
have no option because it screws the rest of my system up at work.
These aren't unique problems. All computing is a compromise - I don't
have a PC at home because I haven't found one that's reliable yet. I
just work as best I can with my humble Atari <g>.

> You know, your theory is a little weird. Take a commercial

> system is totally down.

I take your point, but what you're saying is that commercial systems with multiple _paying_ users still go down - the time and money spent on development doesn't prevent the problem even in "mission-critical" circumstances. This still isn't an excuse for installing, say, NT or Linux and expecting software compatible only with Win3.1 to run perfectly on it!

> Even "clean applications" will bring the system to this halt. For
> your information, "clean" software was used for magic when it
> trashed my C partition twice. WHat I call clean is: If it runs on
> all atari hardware I have, with singletos and mint. To me I call
> that application clean enough.

I understand what you're saying, but unfortunately you or I aren't the arbiters of what is clean to Magic. As I said before, 2B were uncompromising in what they deemed to be clean for their OS. In the same way, I have software that will only run on Magic and won't run on TOS - does that make TOS buggy? No. Does it make the software buggy? Also no. It just means they are incompatible. This is the same argument that came up with each new TOS version. Each new version of the OS aims to be coherent in a new way and applications need to catch up with it. It was ever so...

> I don't even call Calamus or Da's vector clean application

Me neither. When I first ran a CalSL demo on a TOS 2.06 MSTe after I put a CoCo graphics card in with NVDI for the first time it made a nasty mess of my screen. What kind of a DTP package can't handle a large screen ferchrissake! Again, nothing to do with the OS...

> If magic can not take what several atari hardware with singletos
> and/or MiNT could take, I call magic weak.

That's your prerogative, Katherine, but I think you'll have to accept it's just different.

Come on. List the software that falls down and what's running in the background and I'm sure someone here will point to the problem and maybe suggest an acceptable alternative.

The CPU is the least of the problems, sice MagiC doesn't use any of the
030's features at all.

> Falcon was out at that time. I know there's more to it than just the
> processor, but still...

There's a *lot* more. The graphics processor is all new, the sound
subsystem is completely new, the DSP is new...

> So it works perfectly for some people, but not for you and that's the

It's not just my Falcon.

> fault of the OS? That really is pretty imaginative. With just Magxboot

Ofcourse it's the OS fault. What else can it be? If TOS, MiNT and Linux
runs for days or weeks without reboot, how can you say anything else?

> installed the software takes it on itself to crash a machine just by
> existing? It's not possible that it's something to do with either the

If you have read my previous messages in this thread you would have
understood what I'm trying to say. I won't repeat myself.

> installation of the AB or the build quality of the machine? Maybe a
> heat-related problem?

The AB is fine, there's no question about that. A hardware-fault would
have manifested itself regardless of OS.

> You need to have your machine overhauled. Make an appointment today.

My Falcon is probably the most overhauled Falcon in the known universe.

> > I'm not talking about software-compatibility, but *hardware*. MagiC
> > has serious problems on many Falcons.

> Let's be brutally honest. We remember how the Falcon was virtually
> abandoned before it was released. The machines weren't built - they

Exactly! And yet TOS and MiNT works fine and stable. So does MagiC - on
some Falcons. On other Falcons it's as reliable as British cars.

> Yes. HiSoft support had ended at that time so they weren't updated,
> but that'sanother example of a home-brew solution in the absence of a
> standardised method. XMEN_MGR was made available, but wasn't included

It was not a "home-brew solution", in fact HiSoft did everything correct. As from TOS 4 the AES supported cascading menus, and the only way to detect these was by checking the AES version number. appl_getinfo() came with MultiTOS IIRC, and it wasn't even implemented in all versions of MagiC. Thus, if appl_getinfo isn't present, you'll have to check the AES version and rely on this information alone.

> in the Magic because it was only needed by certain programs and they
> didn't want to build in backward compatibility. It's one of the few
> concessions 2B made.

Not correct. Cascading menus was a *new* features that has later been implemented correctly in MagiC. It also has it's own version, menu_popup() which basically does the same but in a slightly different manner (supported by N.AES btw).

> Am I missing something, or doesn't Magic work through the hard disk
> driver?

The hard disk driver is irrelevant here. OK, it can fail, but this can happen on *any* cluster and not specifically the FAT. The reason why MagiC destroys it's FAT fairly often (by that I mean a lot more often than TOS and MiNT) is because the GEMDOS crash with data in the writeback cache. The FAT will then be inconsistent.

> Of course, I agree crashes need to be contained. I'm not quite sure
> how you protect crashed apps crashing the system, but today at work I

By using memory protection, and by having sanity checks in the most unlikely places. Memory protection will prevent applications from destroying the OS, and sanity checks will prevent the OS from self destructing from destroyed data and structures.

> descended onto my screen bringing Windows to a grinding halt. It's

If you're using Windows 9x, you're not using memory protection. That's a major part of the problem.

Hasbro has turned www.atari.com into a subdomain and makes to mention of "Atari" on its new site.

I've hear rumours to protest this act by Hasbro and continue the Atari name. Anyone feel like e-mailing Hasbro and politely asking them to keep our favourite video game name alive?

If they're not interested in the Atari name, then maybe they should turn it over to us Atari users? :)

Hmm, it doesn't crash the OS when it crash under MiNT/N.AES on my
Falcon, but I'm using MiNTnet on the Falcon and STiNG on the TT. So the
common factor here seems to be STiNG.

Hi Derryck,

Most of my 'wire crossing' is because, as now, I answer NG mails away
from my Atari set up and just using a lousy memory!!!! the rest is
probably because I'm thick! The sole reason for my guess is the file
RTR.BGH which comes with the resouce text stripper RTR and which is a
text table of german to english RSC strings. Yet again as I say above,
could be wrong!!!!!!

Bob.

Note that you can also create smaller FAT32 partitions. HDDRUTIL does
this automatially for partitions larger than 2 GByte but you might also
want to use FAT32 for smaller partitions.

Hi Shiuming,

I would have a Falcon, but the guy who is selling one, Paul Mac who
lives only some 20 miles anyway, fails to reply to my emails. I would
really like one, but I want to be able to see it first.

BTW for good Atari stuff, which is a /lot/ cheaper than Ebay, check
out http://www.upmystreet.com, but best for UK residents only.
There's seems to be a lot of Atari gear. Midex, 2 Falcons about 160
quid each, Atari laptop for 200ukp etc... etc....

Why do we still have to enter time/date on startup? Can't you do a
simple call to the AES or something?

>It's located at http://www.uvk2000.com (this is a new URL!).

Unfortunatly it's CAB 1.5 unfriendly.

Well try it quickly at the least. Use the wall wart on a socket with
a switch, and check quickly. /Usually/ the pinouts for items is
positive in the centre pin and negative on the outer. IIRC this was
like my Jags output.

Don't worry, as I doubt you'll do much damge to the wall wart. There
isn't much to go wrong... :)

I already have 1Mb in the box, no simms unfortunately, I got a soldering
iron to it when I was about 14 (ish) and had to solder every flippin chip
onto the mobo manually....nice! Still only using TOS 1.0. I only want to
copy all my stuff I still want before getting rid of it;

Atari 520STFM (1MB u/grade)
Vortex HDPlus 40 (40Mb) other bits and bobs etc....

Of course! I forgot that both those were optional.
I remember that they also sold the SCSI-modification as a kit separately.
Another point of clarification is in place, since it seems like some people
believe that the internal IDE-port was removed in the machines with internal
SCSI; The IDE-port was fully functional in ALL Falcons - both MK2 and MKX.
Another problem with the internal SCSI in the MK2 was that the 2.5" drives
which were mounted were rather slow and it was much better to use an
external 3.5" instead because of this - at least if you want to record
audio...
In the MKX, there was a problem with heat and I know several customers who
had to place the SCSI-drive in an external box instead of inside the MKX, to
get it to work properly - otherwise they'd get lock-ups or other starnge
problems.

Very little, I've just installed it and disabled the boot-log... I'm also
running a few apps ofcourse, but none that should cause any problems at
OS-level.

IIRC there was a patch I used to run in the early days of MagiC on the
Falcon, but I believe that was for locking the floppy and not files. I'm
not using any special patches at all for MagiC now.

>ISA/PCI slots.

To get around this I am right now running my TT permanently connected
to the Internet through a Win-95 pc. The pc is connected with 500
kbit ADSL and runs ip masquerade using NAT32 from
http://www.nat32.com/

This package makes it possible to use a dialup connection on the
local 192.168 side. To "dial in" to the TT I use a faked modem driver
from http://www.kevin-wells.com/net/ and connects with ppp by simply
activating the port in STinG.

With this solution I now have permanent Internet connection using a
null-modem cable at 57600 bps. Works fine on the Atari side but the
pc has to be rebooted now and then. I even tried to run the webserver
Weblight with Geneva and it works fine as long as it does not call
any TOS programs (bug within Geneva). By mapping tcp port 80 to the
TT the webserver can be reached from anywhere.

I might announce here in the near future the url so you can try out
how it feels to surf on a webserver running on TOS. Unfortunately I
have limited time right now to write any sensible html to put on the
server. Besides I need to use the TT to run some programs that are
not very multitask friendly...

Thanks Lyndon. I did that, and have now found that DIR.HTM is written by CAB when you use its option in the original HOME.HTM to list the contents of your hard drive. The last window opened is written as DIR.HTM, though it beats me why it's written to GEMSYS\HOME\!

I presume that the SMP.1 and .8 files take their extender from the colour depth, and again originate from CAB. But I have no idea what they are used for. Probably best left as they were...

Thanks a lot. So I'd better leave them alone then!

But again, why are they saved to GEMSYS\HOME\? Or is this where such
files are meant to go under MagiC? Seems a bit peculiar, as that means
probably that running Smurf (and CAB for DIR.HTM) under TOS they won't
be found.

Hi Hugh,

I'm using a Canon Bubblejet BJ-10e on my Falcon. and it works
fine. If there's not a specific driver for that printer with
whatever program you're using, often another driver will suffice
- or you can modify one to fit. This printer gives clear
printouts (360x360 I think), but you have to careful to not get
ANY water on the paper afterwards or the ink will spread (even if
it's dried). Not an issue for home-documentation, but if it's
bizniz correspondance it might be. It prints in black only.

Hope that helps,

Clayton Murray
Seattle, WA USA

I'm a little puzzled here Uwe, why would one want to install HDDriver in a
MagiCPC setup? Surely MPC accesses drives via the PC's OS?

> controller, being the biggest) and the mk3 (er,
> mkX... mk10?) had a whole lot more differences.

All Falcons have the same motherboard and the same construction (a couple of variations with different components, but essentially they're identical - and those different variations were made before C-lab came into the picture...) - whether they're called Atari F030, C-lab Falcon MK1, MK2 or MKX. Actually, C-lab bought Atari's stock of motherboards and they never made any modifications that were unknown to technicians previous to their takeover - just modifications which could have been made by anyone...
The MK2 was exactly the same as the MK1 - they just removed the internal SCSI-termination resistor packs and placed an internal SCSI-drive in the machine instead of the normal IDE-drive. However, all other things remained the same, so you can still mount an internal IDE-drive as well (if you can find enough space for it...). I guess you're likely to run into some problems with the SCSI-bus if your internal 2.5" SCSI-drive dies, since you loose the termination on that end then if you don't mount internal resistor packs or replace the drive...
The MKX was also exactly the same machine, but they removed the audio connectors from the PCB, to mount them in another place in the chassis - and they made the same change with the SCSI as in the MK2. They also made an adapter cable from the internal keybard connector, to enable use of a Mega ST/STe keyboard - and I seem to recall that they moved the midi and joyports also, but I may be wrong there... That's just about all "changes" there ever were...

I have been using Linux for quite a while with X - running KDE and I love
it. My k6-450 dosent have any problem's with speed at all. The big Linux
killer is RAM, you need heap's to run efficently. I have 128MB which is
fine.
If you want real control of your PC then I alway's recomend Linux, but it is
a real users OS, not designed for the Layman.

I guess all the amount are in US$.
Over here, I see an classified ad for a complete K6-2 system for about US$300, with HDD, CDROM & sound card. The K6-2 is 400MHz which equates to a P2 class CPU. Run a good ST emulator on it and you have a fast Atari emulator.

One thing, the feel is not the same as an real Atari. The mouse feels smoother and smaller than that squarish Atari mouse and the also click are softer on the PC mouse. The PC keyboard are the worst, there is no HELP key on it.

>Today for $300 you can buy Athlon 1Ghz CPU (way faster than G4) +

The cheap hardware which Atari gave us is being to show up as difficulties to 'put' the falcon on a LAN. There are no expansion slot except for that non-standard Internal 'Processor-Direct' slot. Unlike PC and some others have ISA/PCI slots.

The parallel port is bi-directional but most (if not all) of the parallel port ethernet adapter needs a EPP/ECP port. The cheap printer port just cannot take the ethernet adapter. The only way is to hack a parallel port out of the ROM port.

Looking at the LAN port (RS422 or something like that), it seems that one can put a slow RS42x to Ethernet adapter on it. However, on close examination, we cannot use the Ethermac iPrint from farallon as there is no power coming from the LAN port. The only way is to hack a power supply for the LAN port, not to mention the need to write a device driver for this device.

Effectively there is no easy way to put a falcon on a LAN without some hardware hacks.

Tried that already, Dennis, thanks. Apple is too clever for that
sort of thing.

Well, after waiting all weekend for even acknowledgement from any of
the Apple groups, I'm going to take my chances. At worst, I smoke
a gadget I got for free.

Well, no, at worst I smoke my Jag wall-wart, too.

Hi Jo Even,

>> I personally know two people who got a burned MagiC in ROM, there's no TOS
>> needed at all... it doesn't really matter what parts of TOS are needed by
>> MiNT, the simple fact that TOS is needed to run it, qualifies it as a mere
>> TOS-extension instead of an OS.
>This is a really stupid argument which nobody can win... Using this logic
>then you can't call *any* OS that runs on a PC a proper OS, because all of
>them depends on the BIOS and third-party code (drivers). So let's do that.
NO...
The point is/was that MagiC unlike MiNT can be booted without needing TOS, if
someone would like to toss out TOS (no pun intented) and replace it with MagiC
he could, this would be a favourable solution on machines with limited memory.
But I would strongly advice using a TOS-switcher, so that it's always possible
to revert to TOS at any time.
Sorry my logic differs from yours... but bringing in a PC in this discussion
hardly helps, the concept of the hardware is completely different then the
Atari, and IMO can't be compared.

>>With recent written commercial software (1997 and later) you'll have a hell
>>of a job trying to bring down the OS.
>Nah, try CAB, any version. It's unstable under N.AES, and it's unstable
>under MagiC. It's quite usual that it locks my TT if I try to launch any
>of it's modules (like cabdload).
Sorry Jo Even.... I can't reproduce this. CAB itself will sometimes crash but
I never known it to bring down the OS. Whenever CAB crashes here, MagiC stays
alive... even the IConnect connection to the ISP remains intact.
When I use CAB with STiNG running under MiNT/N.AES and it crashes.... then it
takes down the whole lot, including STiNG... :-(

Cheers from Belgium

Hi Lyndon,

>I've read about the removing timeslice info from the magx.inf file and using
>the cpx, but can't find it. I think it may have been an ST Format....
That CPX wasn't supplied with MagiC 4.0... but it's in your mailbox now ;-)

MagiC 4.0 is very rudimentary; it offers no support for LFN, threads, SLB's,
FAT32 etc.. get the latest update and be pleasantly surprised.

Hi Ken,

>>Photoline doesn't have any problem on CT2 and/or MagiC 6 on a Falcon.
>can the same be said for PixArt and DA's /Picture-VektorPro?
Yes...
And considering that DA`s Picture/Vector-Pro were written in 1991-1993
(before MagiC was around), it's quiet remarkable. But both DA's programs
however show some errors when running on a graphic card, since MagiC has
nothing to do with this let us just say they run perfectly in multitasking
and singletasking modes.

You're mis-informed.... partitions over 1Gig are no problem providing you
use HDDriver and an OS that can handle these partitions, once over 2Gig,
FAT32 partitions are created automatically by HD Driver...

> were...

Just for clarification and general interest, not all MK-II and MK-X machines had internal SCSI. C-Lab actually left some of them (like the one I had) with the original SCSI and IDE ports as they were, at a slightly lower price. As I was going to use an external SCSI drive for audio, I baught the External SCSI/Internal IDE version. Internal SCSI ones reportedly caused noise to creep into the audio or so it was explained to me then. They also offered on the MK-X the option of a PC compatible AT keyboard connector rather than the MSTE connector.

What about the SCSI Ethernet adapter I heard about at one point? Wasn't someone going to make a STiNG driver for it? Maybe I'm thinking of a different one. The Falcon's SCSI port wouldn't have any problems or need for "hacks", would it? You could just place the adapter in the drive chain, right? Would this be an option?

From: Dave Parsons <parsonsd@wam.umd.edu>
Date: Sat, 2 Dec 2000 16:03:09 -0500

Hi Dave,

>Now, I prefer to use Everest as my editor (QEDfans: what makes QED
>better?),
I can think of a couple of things...
While Everest may be very good as an editor for Lattice C, it lacks support for modern protocols. QED is an OLGA server, it supports DHST if StartMeUP is installed, it supports the complete Drag&Drop protocol which is only partly supported in Everest, it supports the xfsl cookie for font selection... etc
Not everyone is a programmer, if I for example need to edit a configuration file and change some paths, nothing is easier then using QED. Holding the ALT key and simply Drag&Drop the file/path/directory it will be inserted at the position of the cursor. Editing an HTML file using QED and CAB under the OLGA protocol is another fine example of some of the virtues of QED.
Oh.... and QED looks better under MagiC as well :-)

>I can also give you an example of propagation: there is a program (I have
>always thought it a modem prg, methinks connect) which under TOS is real
>nice, it releases whatever systems it took over once it quits. Under mgx,
>this prg -doesn't- unhook (or mgx doesn't let it unhook),
Bull***, get the latest version of Connect and be pleasantly surprised, it's freeware now so doesn't cost you anything anymore. Connect works just fine under MagiC, I've been using it for over four years and it *never* let me down. Unhooking it, is no problem at all. I suppose you've been using an older version or haven't set it up correctly.

>Why should I write my programs attempting to guess what the user has? --what
>the user is running? Being nice is good, but the OS is meant to keep the
>user-prg from taking over like kudzu, no? --define the boundaries?
I'm a user - not a programmer - you're asking me for boundaries? well if your baby doesn't behave under MagiC I will not use it. It's as simple as that.
You probably don't give a shit about this, but that's an attitide which more programmers seem to share....
You don't really have to guess what the user has, just make sure you're baby runs under TOS, if you haven't used any fancy tricks it should work properly under N.AES and MagiC, if it doesn't then you've got a problem...

>// lot of ten year old applications run happily on it, people are always
>// complaining about the stuff that doesn't run ...
>
>okay, here are some defniate examples....
>i haven't upgraded from v5, but a gent told me he has the same
>problem on mgx v6:

>Lattice C runs fine until you compile and it tells you screwed up. The
>first time it reports a syntax err, mgx (& the whole world) stops.
Luckily the world doesn't revolve around Lattice C....
I said that *lots* of older applications run fine under MagiC, lots doesn't
mean all. IIRC Lattice C has some problems with TOS 2.xx and 3.xx as well, so
I'm not really surprised things go wrong when running it under MagiC.
A good alternative is Pure C or GNU/C which both work fine under MagiC.

Cheers from Belgium

>on my Stacy, so I assume that it's normal.
NO.... it's abnormal!!
I have never managed to delete an open file under MagiC, all I get is an
"access denied" error message trying to delete this kind of files. How on
earth you manage to delete an open file under MagiC is beyond me.
I would have thought that the OS would prevent this to start with... what
have you done to it? :-)

I'm using a H.P. Deskjet 610C. I wonder if that's the last
"proper" non brain-dead Windoze printer they'll produce ? The mono
and colour output are both fine, but I lack the software to tweak the
alignment of the cartridge.

A source close to Infogrames Inc. has told GameWEEK.com that a deal is close to being completed that will have Infogrames buying Hasbro Interactive. Such a deal would build up Infogrames' software library with such properties as Frogger, Monopoly and RollerCoaster Tycoon, as well as Atari's catalogue of game brands.

More details here...

Not bad, though the use aof an ATX design would reduce the cost to buy and
the cost of manufacture.

The addition of a DSP would make a fair difference to the cost of
manufacture surely the Soft DSP ability of the PowerPC range would suffice?

Regards

Julian

Yes, really. Actually FAT32 has been supported for both, MagiC and MiNT,
for quite some time. The maximum partition size is 2 TeraByte or so. In
any case it's larger than the largest hard disk drives you can buy
today.

I've tried to explain why MagiC has problems with the hardware on some
Falcons a few times now, please read my postings again.

> > If TOS, MiNT and Linux runs for days or weeks without reboot, how
> > can you say anything else?
>
> Then it must be incompatible. As I said to Katherine, it's a

Yes! That's the point, it's not compatible with all Falcons.

> > My Falcon is probably the most overhauled Falcon in the known
> > universe.
>
> I've read your messages and can believe you! <g>
> Although that also makes me wonder if that's not a problem too B<

Don't think so. After I removed that horrible Nemesis I haven't had any
problems :-) Apart from a broken floppy which caused some mysterious
DMA errors it has been dead stable for a long time now.

Anyway, I have only had the AB for three years, so I've had plenty of
(bad) experience with both MagiC 4 and 5 on a plain Falcon.

> > - on some Falcons. On other Falcons it's as reliable as British
cars.
>
> Meoow!!! B>

Well, we had an Austin Allegro about ten years ago...

> But again, if it works on some and not on others, then we're back to
> hardware failings or incompatibilities of concurrent software.

No, it's not hardware failings or software incompatibilities. It's
MagiC that's incompatible.

> the criticism. The fact was that Magic pre-dated Multitos (and maybe
> even MinT, but I'm not sure) and also TOS 4. 2B chose a different

Yes, but these features didn't. The version number was bumped up before
MagiC supported everything in the corresponding Atari-AES, that's why
the HiSoft-products had problems if xmenmgr wasn't installed. I'm just
saying that HiSoft did everything correct, so it's a bad example
for "home brewed solutions".

> I accept all that, but my point is that if it's a problem found in
W9x
> too then it's a bit harsh to single out Magic when it's beating the
> combined muscle of the biggest corporations in the world too.

Well, it was MagiC we were talking about, wasn't it? The fact that
other operating systems also crash doesn't mean that I can't point out
weaknesses in MagiC.

Just to set the record straight: I'm not a MagiC-hater. I actually use
MagiC all the time on my TT, and I'm quite happy with it (except for a
periode when I upgraded to 6.0 and it ate my C-partition). If it had
been equally stable on the Falcon when I started using it (MagiC 4 in
1995) I might not have switched to MultiTOS and later N.AES at all.

I love the sales patter on these newsgroups...

Seriously, much as we all love Atari, when you get someone asking why an Atari accelerator costs more than a PC, and more importantly, machines like Hades and Milan cost more than a PC or Mac, you do have to wonder about the sanity of taking that route for normal computing.

Yes - I'd buy one if I had the money, but no-one ever suggested I was sane (and I already own a PC).

The Atari brand should be kept alive - but forget all the TOS clone ideas. Forget emulation. To be relevant to the bulk of society, Atari's name should be applied to a custom-cased PC with a bundle of classic games, a bundle that includes music software, and running BeOS if Windows is abhorrent to everyone (I find Windows 2000 SP 1 to be reliable, fast and perfectly capable of doing the job, and whilst it may be trendy to dislike Windows, it's also rather silly if that route takes you down a path littered with incompatible software, frequent crashes, and time-consuming installs).

Format the disk on the PC, but at the top of the Format dialog box,
select "720K" instead of the default 1.44Meg setting.

The Atari uses a low density disk drive that can't read standard PC
disks, but by formatting it as a 720K disk, both systems should be
able to read it.

Derryck Croker wrote:

> I'm a little puzzled here Uwe, why would one want to install HDDriver in a
> MagiCPC setup? Surely MPC accesses drives via the PC's OS?

There are several reasons you might want that. KOBOLD doesn't have to go into GEMDOS modes for partitions that are handled by HDDRIVER and thus copies fast again. Certain tools, e. g. those using XHDI or disk monitors etc., work again. Usually these tools cannot access any data under MagiCPC except for container drives. Now than can access partitions as they can do it on a real Atari. And, a less important issue, but it happened to me once that I could not access a SCSI peripheral (DVD RAM) since there was not driver for Windows NT available yet. With MagiCPC and HDDRIVER I could use this device, but only from within MagiCPC, not directly from Windows. Even now there are tricks you can do with HDDRIVER with DVD-RAM drives you cannot do under Windows. For example using DVD-RAM media like they were CD-ROM media.
Of course you also get any other feature of HDDRIVER, e. g. optional SCSI verify. I don't know how the Windows drivers handle that.
Whether running HDDRIVER under MagiCPC makes sense depends a lot on the software you're using. But even it's only for having KOBOLD running with full speed it may be useful.
BTW, it should also work to access Linux partitions under MagiCPC this way, something which I don't know whether this is supported by Windows at all. I haven't digged deeper into this yet but when you install MiNT under MagiC (this works when loading a TOS 2.05 image into MagiC, as described in the documentation for MagiC), you should be able to also start the ext2fs file system driver of MiNT. And this way you should be able to access both Windows and Linux partition from MagiCPC.

Actually, the Atlas-Mercury kinda sucked. The Atlas used to collapse
every time they put a Mercury capsule on top (until they finally fixed
it). Not a very good rocket for sending people to space. It was
considered a poor rocket as soon as it was built. Maybe you could
compare it to the early Titan series, though ;-). That rocket always
worked pretty well.

But other than that, I agree with you!

Just a silly side note...

When I finally got one of the first Atari Falcons sold in Europe, I knew
what was wrong: It should have been a minitower with a big turnnob at
the front screaming look I'm a Music monster with build-in tuner and
amp, hook up your speakers cos I've got CD quality sound written all
over me.

A few leds (like the BeBox) but than of cource displaying sound output
would have been a nice finising touch.

> 3. Expansion slots are good to have. Again I'd rather have a special kind of

I don't care for expansion, I've got a powerbook as my main machine. I
do like upgradability though. Like a maxed out Cube: no fan but you can
upgrade CPU, memory, Airport en video. Everything else goes over USB,
400Mbit/s FireWire and 10/100/1000Mbit/s Ethernet.

> 4. Most important is for it to be 100% Falcon/TT/STe compatible. No DSP

Why a DSP the AltiVec units on the Motorola G4 nicknamed CPU do DSP and
vector functions. Without the cost of an extra MHz bus and chip. What do
you think an separate DSP would cost if you make it run in the MHz
realm?

That file is only the bubblegem help for RTR. I can't find anything that
resembles a table - maybe your archive has a file containing the object IDs
and text strings exported from RTR? It's certainly not supplied as standard.

I've a feeling that you're referring to the latest incarnation of RTR which
appears to add the ability to edit/translate text within itself, with the
option of using some kind of dictionary. DDP is currently finishing the
translation of the RSC and bubblegem for this :-)

I'll announce in here once it's ready for download.

I don't think so. Note that you must explicitly tell HDDRUTIL to create
a FAT32 partition when partitioning, as described in the manual and/or
README. Also note that at least HDDRIVER 7.9 is required in order for
HDDRUTIL to support the creation of FAT32 partitions when partitioning.
Older versions didn't support this.

FWIW, this sounds to me like a hardware problem and I doubt very much that changing the contents of the drive would affect the problem. I especially doubt that the size of paritions has anything to do with it.

I've tried it but coulnd'nt get it set up very well. DEad slow on an
ST. All the icons like the Cancel/OK buttons on the fileselector were
just a shade of black. Am I using a colour version, as there was
supposed to be two versions, but never found any monochrome ones.

6794. Email troubles

Newsgroup: comp.sys.atari.st
Date: 2000-12-05 00:00:00 UTC
From: dhunt@zetnet.co.uk
Message-ID: <3a2d4202$0$179@news.zetnet.co.uk>
Source record: 53479

Hi Atarians

Over the last 2 days I have been getting some trouble with my emails. Your thoughts,advice etc would be appreciated.

I am using,as you can see from the headers,NEWSIE 0.96 to collect my mail and newsgroups. All goes well to download my news for Offline reading,over to "Get Mail" and,providing there is something there NEWSIE starts to download it. If (just as an example)there are say 4 messages the first 3 come through with no problem the last one will start to download,hits roughly 4116 bytes (status window) and bombs with 2 bombs and sends me to the Desktop.

Going back to NEWSIE and opening the Mailbox shows it is empty,BUT if I go back to the Desktop and open the NEWSIE file and then the Mail Folder the 4 messages are there to be read. The last one (In this case MAIL004.TXT) is incomplete. THIS MESSAGE IS FROM THE SAME SOURCE (same message to be honest) each time. Deleting it makes no difference,leaving it in the Folder only means I start a collection of the same files in the folder.

Any thoughts on how to get rid of this email? I have tried wiping NEWSIE completely and starting afresh.

Apologies for the rather long spiel.

Regards Derek

FMC II I'm running so I'm not sure what is wrong. Everytime you start
the app, it asks for a date and time.

>>>It's located at http://www.uvk2000.com (this is a new URL!).
>
>>Unfortunatly it's CAB 1.5 unfriendly.

I get "The resource requested could not be found on this server" then
it quickly loads to another page with "DirectNIC: Horrible 404 Error"
as the site's name. I think I'm using CAB.OVL version 1.18 as that
was the only version to work with CAB 1.5. I suppose an upgrade is
needed, but I really can't afford it. I have better things to get
like a Falcon or something, anything better really!

That's because you use a Mega STE
with an integrated RTC whereas
Lyndon uses a "normal" STE without.

>with my old thang?

Almost any parallel-port printer can be used with the Falcon, *provided*
you have the correct driver for it (or can adapt an existing one). Does
your Bubblejet support the HP commands, or Canon's? If the former than
any Laserjet driver can be used - but some older programs only have
drivers for pin-printers or offer a limited number of commands that can
be entered for a given setting, which may not be enough for an HP-type
printer.

A lot depends on what program you are using to generate your invoices.
I still do most of mine in 1st Word Plus, which has drivers for most
printers. If you use NVDI and the text program supports GDOS output,
there is a very wide range of printer drivers available. Even more can
be found in IdeaList, which allows more layout control of ASCII text or
1st Word files for printing.

Well in my PC building days on occasion a new drive would appear
to be bad, refusing to format or partition. All that was
required was getting a special re-init app from the manufacturer
that would do something to the drives. After that they would work
fine. I am refering to the used drive with the bus error only here.
It is my guess that the machine I pulled it from (amiga) has placed
some data where TOS looks for executable boot data and this may
explain the bus error.

I agree fully the new drive is a hardware problem, but I am willing
to give the used one a re-init test since I know it's used.
Worth a try I think. ;-)

A very interesting post Uwe. I hadn't considered the points you made - and I
was pleased to read that one could access a drive in a fashion which leaves
Windows out in the cold! :-)

I'm guessing that one could also add the ability to access a SCSI scanner
ScanX) from within MPC with either HDDriver or SCSIDRV installed.

Get Popwatch from http://www.the-gap.demon.co.uk/

This program is simple to setup and can retrieve the dodgy(?) email
to a local file and delete it on the server. I have used Popwatch for
a couple of years and it works very well.

Popwatch can be set up to perform all online activity for Newsie as
well. In combination with Newswatch you hardly need to go online with
Newsie at all.

(Note: I have never used Newsie myself.)

I used to think those first Space Cowboys must have been either
awfully brave, or awfully stupid... just sitting there watching some
of the early films of Atlas boosters collapsing into a ball of flame
wouldn't have given ME much of a warm fuzzy, if THAT was the vehicle
that was supposed to boost me into orbit.

(And those computers..! Have to run down and replace half the
vacuum tubes before they could calculate the re-entry burn..!)

And that "cheap hardware" 1963 Corvette Stingray didn't even have
four-wheel anti-lock disk brakes or high performance radial tires.
What was Chevy thinking..?

:)

Hi Peter

You're probably right, I think it's a Magic thing. On my comp they're stored in Smurfs on folder. Come to think of it, been a while since I used Smurf, maybe one sets this in prefs? Then it should work just as well under plain TOS.

Hi Jo,

On 3 Dec 2000 01:18:08 G, Jo Even Skarstein wrote:
>> So it works perfectly for some people, but not for you and that's
>> the fault of the OS? That really is pretty imaginative.
> It's not just my Falcon.
> Of course it's the OS fault. What else can it be?

If it works for other people, as you say, and not you then it can only be your machine or what software you run with it. If it works for some people, as you say, then it's impossible to be the OS.

> If TOS, MiNT and Linux runs for days or weeks without reboot, how
> can you say anything else?

Then it must be incompatible. As I said to Katherine, it's a different OS that has requirements of its own.

>> With just Magxboot installed the software takes it on itself to
>> crash a machine just by existing?
> If you have read my previous messages in this thread you would have
> understood what I'm trying to say. I won't repeat myself.

This was in response to you saying you boot up with just Magxboot and it crashes within 30 minutes of its own accord. What's to understand?

>> You need to have your machine overhauled. Make an appointment today.
> My Falcon is probably the most overhauled Falcon in the known
> universe.

I've read your messages and can believe you! <g>
Although that also makes me wonder if that's not a problem too B<

>> Let's be brutally honest. We remember how the Falcon was virtually
>> abandoned before it was released. The machines weren't built -
>> they were thrown together...
> Exactly! And yet TOS and MiNT works fine and stable. So does MagiC

Meoow!!! B>
But again, if it works on some and not on others, then we're back to hardware failings or incompatibilities of concurrent software.

>> Yes. HiSoft support had ended at that time so they weren't
>> updated, but that's another example of a home-brew solution in the

I understand what you're saying and can remember the answers given to the criticism. The fact was that Magic pre-dated Multitos (and maybe even MinT, but I'm not sure) and also TOS 4. 2B chose a different route and stuck with it. This wasn't popular, but because they were creating a _different_ OS (and tbh Multitos hardly looked like a viable product, so who could blame them for ignoring it) they took their own route.

It's not a bug - it's a deliberate alternative track.

>> Am I missing something, or doesn't Magic work through the hard

I see what you're saying. I get occasional GEMDOS crashes too, but usually when I'm trying out unknown software. I don't know enough about the subject to offer anything new, except to say I don't get problems with my FATs... (not much help, I know...)

>> Of course, I agree crashes need to be contained. I'm not quite
>> sure how you protect crashed apps crashing the system

>> descended onto my screen bringing Windows to a grinding halt.
> If you're using Windows 9x, you're not using memory protection.
> That's a major part of the problem.

I accept all that, but my point is that if it's a problem found in W9x too then it's a bit harsh to single out Magic when it's beating the combined muscle of the biggest corporations in the world too.

To respond to this message, please use the enclosed email address rather than your reply button. Dealer enquiries are welcome.

- Last Updated 12/04/00
- Sold items removed

I have a limited amount of brand new Atari Jaguars and Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - 2 units left
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

One can use a MAC Mini Midi Interface (single port)and use Steinberg's
Lan driver. It works but it must remain unpluged until the Falcon has
fully booted.

I'm not always a fan of Atari's methods or philosophy in regards to
R&D, but most of this is like saying the Mercury Atlas was a crummy
launch vehicle compared to the Space Shuttle.

The Atlas got us into space just fine, thank you, using the technology
of the time.

When the TT was designed, there WERE no PCI slots ANYWHERE. The
"cheap" parallel port was just like EVERY OTHER parallel port on the
planet - there WAS no EPP/ECP... AT THE TIME.

The LAN port was designed as an RS422 because that WAS what LANs were
using at the time - ethernet was barely becoming standard enough to
allow "LANS" from various manufacturers to inter-operate.

Yes, you can't just shove a GigaBit Ethernet PCI card into a TT - and
you can't stick a 4X AGP card in one either.

I'll be first in line to criticize Atari's policies, but blaming them
for not using a crystal ball and designing the TT like a computer from
10 years in the future is a little silly.

6821. RTR.BGH correction

Newsgroup: comp.sys.atari.st
Date: 2000-12-06 00:00:00 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <90mgurinp1@plutonium.compulink.co.uk>
Source record: 53346

Hi!
Yesterday I published a replacement bubble-help file RTR.BGH for
RTR1.11. I only noticed later that the header was wrong; a quick check
shows that it's wrong in the German version as well! :-(The author
obviously retained the header from an RSM.BGH file he had written.

The first lines should read:
```
------
#BGH 000 000 000

BubbleGEM help-file for ResourceTextReplacer v1.11 by ARDISOFT
Translated by D&D (Derryck Croker & Dennis Vermeire)
--------
```

Not that it makes any difference to the working of the help, but it
should help preventing confusion if you read the file text.

Regards, /Peter/

I saw something today that made me think...
I taped the Goodness Gracious Me night on UK Play on sattellite and noticed an advert for LA 7 which is S-Club 7's 'We love ourselves!' TV show. In the advert one of the boys in the group is wearing a T-shirt with a very large and rather blatant Atari Logo on it. I want to know where I can get such a t-shirt.
Has anyone else noticed anything about Atari on TV recently? (apart from Hasbro re-releasing the classics with a twist under the Atari badge)

I saw something today that made me think...
I taped the Goodness Gracious Me night on UK Play on sattellite and noticed an advert for LA 7 which is S-Club 7's 'We love ourselves!' TV show. In the advert one of the boys in the group is wearing a T-shirt with a very large and rather blatant Atari Logo on it. I want to know where I can get such a t-shirt.
Has anyone else noticed anything about Atari on TV recently? (apart from Hasbro re-releasing the classics with a twist under the Atari badge)

You can't boot from a FAT32 partition and you will lose all your data on
this partitoin when converting it to FAT32. FAT32 is quite useless
unless you have a need for really large partitions and don't use MiNT.
For MiNT it makes more sense to use Linux compatible partitions instead.

That's correct. You don't need HDDRIVER for that but only SCSIDRV.
Provided, of course, your scanner drives is based on the SCSI Driver
interface.

Do you boot from IDE ? I had to throw away the original IDE HD and buy
a new fast one before I could use HDDriver in CT2 turbo mode.

When you select external boot, i use the standard routine in the tos
that search about IDE0 and SCSI 0 to 7. This code use the dmaread
function to read the boot sector and after execute it. The only change
between normal and turbo mode is the speed: so perhaps, your hdd is too
slow to start and you must wait a while. So select the wait option and
enter a good value of time (15 seconds to start): this option (like the
test ram) work only after cold reset of first start of the computer.

Once upon a time <B6530D4E.62DA%nameerf@flash.net>, Michael and Nicole
Freeman <nameerf@flash.net> grabbed chalk and scrawled:

>Not to rain on your parade, but what would be the point?

To keep the Atari brand alive and visible, something which Hasbro appear
to have found to be beyond their capabilities after a brief attempt.

>What I think we all
>want in any new "Atari" computer here is something that will not only be
>fast and reliable but, oh, I don't know, maybe run Atari software?

Exactly /which/ new Atari software do you want to run?

The old guard of Atari users are never going to be happy, and to be
frank, /we don't matter/ commercially. So what if a few thousand of us
would rather use Papyrus than Word? It doesn't make anyone enough money.

You want to run Atari software, well, there, there's your ST/TT/Falcon.
Most Atari software was written to run on them.

You can't make the machine faster without sacrificing software
reliability (if you could have done, then every musician in the world
would have chucked their ST out long ago and bought the Falcon, but
discovering that most of their software had problems or simply wouldn't
work, they stuck with the ST, and if they had used a Falcon, it's nearly
always for recording). The consumer isn't going to go through the
hurdles required to make Hades/Milan clones genuinely usable, and if you
throw back that they can run Linux, so what? So can a PC clone for half
the price.

>I could
>buy any old PC and slap an Atari label on it. Would that change the computer
>a whole lot? I don't think so.

No, it wouldn't. Hence the marketing.

>Besides there's a reason I don't own a PC.
>Making an "Atari" that just ran Windows and PC software would make me want
>to puke. Atari actually tried that once with their "Atari PC". That didn't
>get them anywhere. What makes Atari computers unique is the character of its
>operating system(s), the spirit of not being just your everyday ho-hum
>boring pain in the butt PC, the people here who love these machines, and for
>me, just knowing that I use a really cool old non-mainstream machine with
>relatively few problems.

Whoosh. I owned a BeBox. Notice the past tense there.

You or I don't figure in the equation. We've got an Atari to run Atari software. I hate to say it, but there's little relevance in TOS-based machines these days, beyond 'enthusiasm'. And enthusiasm rarely makes commercial sense.

>So what if there's not always software for what I
>want to do. That's what I bought a Mac for.

Apple don't license their technology anymore, otherwise I'd have suggested Apple clones.

>The software that does exist is
>great, and the machine (besides speed and other "modernity" issues) is a
>great machine that I love to use. Reducing these great machines to simple
>Bill Gatesian zombie-clones would be the biggest waste of time, money and
>energy possible.

The ST was little more than a clone of a CP/M based system with a soundchip tacked on. The Amiga offered more 'unique' qualities.

I'm not dissing the Atari range, I just spent a fair amount on a Falcon ferchrissakes, but I'm trying to be realistic.

PPC Clones are a good idea, but they are expensive and don't make financial sense. If you want to capture an existing market, you forget about the computer, take the easiest route (PC), and work on /software/ to provide an easy migration path.

Make it easy for DTP people and musicians to migrate to your Atari PC, then use the profits to develop a real alternative, not something sadly half-baked. A PPC based Falcon with Videl accessing it's own RAM, G4 providing the DSP, and the OS in Flash ROM allowing for the real benefits of the Atari - OS stability.

I'm not thinking 'what's the next level for Atari ST technology'. ST technology is fundamentally a dead end. I'm thinking 'what can be done to keep Atari alive, and preferably making computers'.

Richard

First, let me say, I'm sorry if I was excessively harsh in my last posting.
I misunderstood your intentions and got a little upset.

>> Not to rain on your parade, but what would be the point?
>
> To keep the Atari brand alive and visible, something which Hasbro appear
> to have found to be beyond their capabilities after a brief attempt.

I think the reason Hasbro has had trouble keeping Atari alive is because the name Atari doesn't carry any weight anymore other than for nostalgia. And the newer generation of video game players either aren't interested in nostalgia or may not have even been alive in Atari's hayday, so wouldn't feel nostalgic anyway. What today's game players want is something flashy, modern, and gruesome (if the games advertised on TV are any indication). And Atari games weren't any of that, and lose something of their charm when made into that.

> You can't make the machine faster without sacrificing software
> reliability (if you could have done, then every musician in the world
> would have chucked their ST out long ago and bought the Falcon, but
> discovering that most of their software had problems or simply wouldn't
> work, they stuck with the ST, and if they had used a Falcon, it's nearly
> always for recording).

I for one did ditch my ST for my Falcon, and couldn't have been happier with my decision. I can still play many of my ST games and other software (not 100%, and some via Backwards or other ST emulation, but I don't mind as games weren't my forte anyway), as well as a bunch of TT and Falcon software that are even better. And as far as new software goes, I believe the push now is to make software that is less system-specific that would run on any GEM/Magic/NAES-based machine.

>> I could
>> buy any old PC and slap an Atari label on it. Would that change the computer
>> a whole lot? I don't think so.
>
> No, it wouldn't. Hence the marketing.

What angle would you market it with? I would think it would be pretty tough since it would simply be a new unknown face in the crowd of existing PC's? It would have to be something pretty incredible to compete with the likes of Gateway, Dell, HP, Compaq, IBM, etc. who've been well-known in the PC world for a long time.

>> So what if there's not always software for what I
>> want to do. That's what I bought a Mac for.

>
> Apple don't license their technology anymore, otherwise I'd have
> suggested Apple clones.

And I personally enjoy using my Atari more than my Mac, too. The Mac is just a stop-gap measure so I can do all the Internet work I need to do that the Falcon is incapable of.

>> The software that does exist is
>> great, and the machine (besides speed and other "modernity" issues) is a

>
> The ST was little more than a clone of a CP/M based system with a
> soundchip tacked on. The Amiga offered more 'unique' qualities.

In hardware, maybe. I'm talking about the whole package that's unique. OS, software, usability, MIDI, everything that the ST/TT/Falcon evolved from beyond the CP/M construction. And when I say uniqueness, I'm comparing it to the PC, which has become so blandly commonplace. As far as the Amiga goes, they're in more or less the same position as the Atari crowd. I think most small, non-mainstream platform offers some unique character that PC's and Mac's can't compare to.

> Make it easy for DTP people and musicians to migrate to your Atari PC,

> half-baked. A PPC based Falcon with Videl accessing it's own RAM, G4
> providing the DSP, and the OS in Flash ROM allowing for the real
> benefits of the Atari - OS stability.

I see. This is where I was misunderstanding you. So you're trying to make an Atari PC to capture the *PC* market, then use the money to produce an Atari-clone, right? That makes more sense and is an interesting idea if you could pull it off. I was misunderstanding your intentions by thinking you were trying to make an Atari PC to tempt Atari users away from their Atari's and into the PC world. While I think this cause is much better than my original perception, I think you'll still run into the problem of PC's being so common and other companies being more of a household name than Atari is right now, that you won't grab all that many PC users unless what you produce is incredibly stunning, incredibly well-made, and incredibly cheap. I would applaud you and do what I could to support you in the venture, though, if you could do it (unless it meant having to use Windows. YUCK! ;).

Hi

NO.. No.. No

The Atari ST uses a DOUBLE DENSITY disks (720k) not a 360k one!!! Modern
pc use HIGH DENSITY disks (1.44).

The disks are different, HD have 1 write protect hole and a hole u can't
close, they usually have 'HD' on them. The media, the stuff that your
valuable data is written too, is different as well.

Some Atari's will cough and splutter reading a HD disk formatted as a
720k one!

NONE of my DD Atari floppies will read one (hd one that is)! I do have a
very generous external drive that WILL read them.

All it takes is 1 bit, in the bit stream and your data is gone. What's
more you may not be aware of the corruption, the file may read ok, but
it only takes 1 eighth of a byte!!! 1 fraction of a fraction of a nano
second wile reading and you've lost that valuable data!

6850. Pictures in Papyrus Base

Newsgroup: comp.sys.atari.st
Date: 2000-12-06 00:00:00 UTC
From: osian@zetnet.co.uk
Message-ID: <3a2ea200$0$179@news.zetnet.co.uk>
Source record: 53434

Does anyone know how to store pictures in a Papyrus database? I can define a field as Picture data type but can't work out how to get an image into it.

The data entry form simply displays a box with the text "You may drop an image into here" in it, which is not very helpful for a single-tasking system. The Help offers no useful help, being frustratingly slow and searching for what I would consider to be key words ("picture data type" etc.) produces nothing, only a statement to the effect that pictures may be stored, without saying how.

Maybe I'm missing something obvious!

I've 'solved' the problem ;-)

I got my daughter to download my mail for me, she uses a Yahoo account on
her PC. You can get at your e-mail from it via pop3 call(I think).
She loaded all the mail without problems onto her system & then deleted
the e-mails on the server. I've just got some fresh mail without
difficulty. Still don't know what caused the original problem but this is
one way of sneaking round it, you'll have to find someone with a PC though.

Go to
http://www.geocities.com/SiliconValley/Bay/8745/pages/hardware.html
There you will find a couple of options for connecting IDE to Atari ST. I
would recommend the solution by Mario.

> There's seems to be a lot of Atari gear. Midex, 2 Falcons about 160
> quid each, Atari laptop for 200ukp etc... etc....

Yes, only I've seen a lot of stuff
that's "cheap" from such places
and ends up needing more in the
way of repairs and replacement
parts. A bit like the chap who
bought an ST for £1 then found
it needed repair... You can't see
the stuff and you don't know its
history.

I removed the Nemesis a few months ago, my Falcon is definitely more happy without it. Less DMA-trouble and no black screen at power-up (this sometimes happens because the RTS-pin on the keyboard ACIA goes high for a split second, thus switching the Nemesis to 40MHz and back just as it powers up).

6856. Q:upgrade floppy for 520

Newsgroup: comp.sys.atari.st
Date: 2000-12-06 00:00:00 UTC
From: yf110@vtn1.victoria.tc.ca
Message-ID: <3a2ec03e@news.victoria.tc.ca>
Source record: 53440

Hello...

Some time ago I upgraded the single sided floppy drive in a 520 ST I was given by simply replacing it with the double sided (720K) floppy drive from my non-working 1040. I do not recall having to do anything other than unplugging the old one and plugging in the "new".

Floppy drives are so cheap now I was thinking of replacing it with a 1.44 floppy drive.

Can I just exchange the old drive (double sided 720K) for the new drive (double sided 1.44M) or what else would I have to do?

I also have an external single sided floppy drive - I have the same question - can I simply put in a new drive, or what else would have to be done?

Thanks for any suggestions or pointers.

6858. Sting/COPS,X/ZControl incompatible?

Newsgroup: comp.sys.atari.st
Date: 2000-12-06 00:00:00 UTC
From: rking@zetnet.co.uk
Message-ID: <3a2ec438$0$175@news.zetnet.co.uk>
Source record: 53442

Hi all,

My latest Milan problem, like all the rest, 'cos I can't keep well alone!! Tried IConnect instead of Sting, so disabled Sting etc. IConnect much faster on CAB, but need Sting for Amail and Newsie. When I went back to Sting, something had happened such that none of the control panels Cops, ZControl or XControls will load. If I change Cops to an APP and click on it after Sting Loaded, screen freezes. I use MagicMilan and Jinnee. It all worked well before I tried out IConnect. Wierd!! When I engage DIALER.APP, it tells me Sting is not activated, (because the Sting CPX isn't active) but allows me to go on line at 19,200 instead of my usual V96.

Any ideas, please.

Bob King.

Fortunately, no. If a printer claims to work under DOS (which nearly
all the present HP printers do), you'll at least be able to print. I
use a 612CL (effectively the same as your 610), and 600dpi black and
300 dpi color work great using the 600C drivers.

Erm, what's the picture window?

I think I *am* missing something obvious!

When I bring up the data entry form, I've tried double-clicking in the
picture field, also editing the text displayed in there to the
pathname of the file I want to include, but don't get any result.
There doesn't appear to be an icon for a picture window, and a search
in the Help for "picture window" doesn't return anything.

It will never be fast on a 68000, but v0.904 is at least twice as fast as v0.7b
The black buttons were a feature of v0.7b. :-)

Did you try the most recent version?

Hi Steve,
If you do a search of "Atari" on Hasbro's site, you'll get an Atari
game related page (logo on a pic of a console). Also, there's a copyright
link there listing Atari Interactive (n affiliate of Hasbro) as owning
the Atari copyright. Atari is'nt listed as a "platform" but it is
listed in a pop-up (catagories, I think).

>>Well, after waiting all weekend for even acknowledgement from any of
>>the Apple groups, I'm going to take my chances. At worst, I smoke
>>a gadget I got for free.
>
>So, how did it go?

Actually (sheepish grin), a local friend (hi, Mike!) suggested I
talk to the local Mac dealer. No, now wait! Every other time
I had gone in that shop, I got zero help, so i had a mental block
against even considering it.

So I called them and asked them my question. Responses:

1. What's a PowerCD? (they don't know their own products.)

2. What are you going to do with it? What's an Atari?

3. Don't use that radioshack power pack, bring it in and we'll
sell you an official Apple power pack!

So now, I guess it won't hurt to wait a bit more til I can go
by the store and see how much a power pack costs. If they got
one and the PowerCD works, I can (a) buy it if it isn't too
much or (b) throw my meter on it if it is and get my answer.
If they don't have one and have to special-order it, my price
threshold goes way up, before I say "never mind" and proceed
with my experiment.

The original parallel port does have 4bytes input, they allow slow bidirectional input. This was in the XT specs. Even the Falcon parallel port does not have these 4bytes input but it is bidirectional! The earliest parallel port ethernet adapter workes on using this slow 4bytes input lines. The EPP/ECP specs may be later than the ST/TT/Falcon (i am not sure) but Atari lamed the parallel port by not providing the 4bytes input.

>The LAN port was designed as an RS422 because that WAS what LANs were
>using at the time - ethernet was barely becoming standard enough to
>allow "LANS" from various manufacturers to inter-operate.
>

The RS422 was used by Apple. I guess Atari STE/TT/Falcon was trying to be a Mac killer (They always wanted to beat Apple even back in the Apple][days with their 400/800). I bought my ST in 89, and my Falcon in 94. But back in 88, the place where I was working was using 8086 (slow 4MHz or smething like that) and 80286 (8-12MHz) machine, and they were all on the Ethernet LAN using Ethernet cards in their ISA slots . All the servers (old DEC/SUN) and even some of the manufacturing equipment controllers are on the LAN. Funny that in University (years before I started working), we were studying IEEE 802.3 CSMA/CD protocol which what Ethernet is. When the TT came out around 89/90, Ethernet was already in use almost everywhere, and I am sure that when the Falcon came out in 92, definately that Ethernet was widely used along with the Internet. (Internet does not imply Ethernet but they go hand in hand in popularity).

They should have stuck a ISA port into Falc or TT. Their next project (fal040??, killed in favour of jag) suppose to have several ports. Anyway, the Atari 386 PC clone had ISA port in them, so they knew how to use them.

>I'll be first in line to criticize Atari's policies, but blaming them
>for not using a crystal ball and designing the TT like a computer from
>10 years in the future is a little silly.

They somehow did, didn't they, with that CD-ROM reader :-)
Way ahead of everyone else.

Not to rain on your parade, but what would be the point? What I think we all want in any new "Atari" computer here is something that will not only be fast and reliable but, oh, I don't know, maybe run Atari software? I could buy any old PC and slap an Atari label on it. Would that change the computer a whole lot? I don't think so. Besides there's a reason I don't own a PC. Making an "Atari" that just ran Windows and PC software would make me want to puke. Atari actually tried that once with their "Atari PC". That didn't get them anywhere. What makes Atari computers unique is the character of its operating system(s), the spirit of not being just your everyday ho-hum boring pain in the butt PC, the people here who love these machines, and for me, just knowing that I use a really cool old non-mainstream machine with relatively few problems. So what if there's not always software for what I want to do. That's what I bought a Mac for. The software that does exist is great, and the machine (besides speed and other "modernity" issues) is a great machine that I love to use. Reducing these great machines to simple Bill Gatesian zombie-clones would be the biggest waste of time, money and energy possible.

Hi Mike.

You have hit the nail right on the head. Yes it is a message from
the net minder,or rather a part message. Yes other mail does load
and NEWSIE cant see them and the only way to read them is to go
into the MAIL folder.

Thanks for your input.

Many thanks for your input John.

I have tried that but as I explained the emails just are not seen
by NEWSIE,thats those before the offending one,and as NEWSIE reads
the last one it bombs out throwing me back to the desktop.
The mails can be found though by manually entering the MAIL
folder.

Derek,
Aside from switching mail programs, another way is to call your ISP
and have them delete it on their end. Also, If you have Earthlink,
they provide an on-line mail service (I don't particularly care for)
where files can be deleted, etc.

I get no problems and I`m only using a "normal" STFM. I enter the
date/time in the Control Panel and UVK 2000 (8.1) automatically
accepts it and shows it when I call it for use.

Wee, I got it, for only 150DM. It was a really tough fight the last
seconds. Remind me to tell you what it is, when I actually have it in
my hands. Then we have to find some space in our rack, but that
shouldn't be too hard, I think. :)

I have Falcon schematics, but there must be some difference between the NTSC and PAL motherboards that cause problems I don't see. My AB and MS work fine at 40Mhz. I know several other PAL users had clock problems as well. There are only small changes, but something must cause signal problems somewhere (real scientific statement there). I have a Sparrow, and was toying around (with the idea of) speeding it up. The motherboard is quite different, socketed COMBEL, CPU and DMA however, and would be afraid I couldn't trace a problem if I damaged something. Another problem is identifying the proper place to attach the wiring of the AB as the GALs are not laid out the same, nor have the same markings. I have an adapter to mount an SMT COMBEL into the PGA COMBEL socket, but haven't gotten around to it. Sparrow video modes are not the same as a Falcon. It just seemed easier to burn ROMs for it while playing around with an 060 on the Afterburner.
Now the PAK into STacy has my attention, I doubt I will work on the 060 this winter;).

Ah, yes. I have Papyrus Gold too, and it allowed you to insert
pictures into your document as you say. This is still available in
Papyrus Office (after all, they wouldn't *downgrade* the word
processor!) but there is now a new database module. You can define
fields as any of the standard types, plus a "picture" data type.
Records are entered via an enhancement of the forms facility.
However, what I'm having trouble with is getting an image into a field
- it doesn't work the same way as inserting a picture into a
word-processor document.

In any case, they bear no real relation to
the actual speed of the machine because
they are manually set by jumpers. You
can make them display any speed you like.

>than unplugging the old one and plugging in the "new".

Normally, no problem. I had a SS Chinon drive fitted in my original STFM
that had a special connector and used a small pcb to 'translate' from
the standard Shugart connector. On removing this a DD replacement drive
worked first time. Compared to a PC, you usually have to twist the cable
to fit the Shugart connector 'the other way round'.

>Floppy drives are so cheap now I was thinking of replacing it with a 1.44
>floppy drive.
>
>Can I just exchange the old drive (double sided 720K) for the new drive
>(double sided 1.44M) or what else would I have to do?

No, you need a small adaptor circuit to double the clock-frequency in
order to use an HD drive in HD mode. At one time TUS (The Upgrade Shop)
sold them for a few pounds; don't know if they are still available.
Needed a connection broken and another made on the Yamaha sound chip,
which doubles as a floppy controller/driver.

>I also have an external single sided floppy drive - I have the same
>question - can I simply put in a new drive, or what else would have to be
>done?

For a DD drive, yes, provided it fits the case. If it's a PC one then
the ID has to be changed with a jumper or solder pad. If you have
modified the internal drive for HD, then you can use an external HD
drive too. Depending on model, this may need an extra wire taken back to
the ST for HD disk detect (on some it can be done on the existing
multiway). TUC supplied different small AUTO folder programs for only
the internal, only the external and both drives being HD. On ST's before
TOS2.06 (I think) you also needed a special formatting program for HDs -
later models had this facility built in. But most of the PD and
commercial formatters can do the job.

>Thanks for any suggestions or pointers.

Many people consider it unsafe to use HD replacement drives with
unmodified STs with DD disks, let alone HD disks, though DDs worked
fine on my machine before I fitted the HD conversion. HD disks need a
higher writing current as they have a higher coercivity magnetic
coating, but most drives, I believe, adjust this automatically from the

HD detect hole sensor.

I managed to see a picture in the database. I created a new file with a picture field. I clicked on the middle icon (looks like an envelope)of the group of 5 at the top right. A grey area appeared with a white rectangle containing the words "You can drop a picture here." The rectangle handles can be grabbed to alter size/shape. I clicked with the right button on the rectangle and got a submenu which included "Graphics" at the top. Clicked on this and got the file selector. Selected an image, clicked on OK and the image appeared in the box.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Hello, my name is Benjamin Smith. I'm a Collector & Jaguar Game Player.
With all my games to play, I have no one to play Games with on my Atari
Jaguar. I live in Portland, Oregon. USA and I'm looking for Atarians to
play Jaguar Games with. You don't necessarily have to have a Jaguar.
Most any Atari will do. I'm thinking of starting Atari meetings in
Portland. Focused on Gaming but still supporting any Ataris. Call Ben
anytime at (503)256-9974 or E-Mail:

e-mail: atari@benjamin.net

If I'm unable to answer, leave a message and I'll call you back.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
bensmith@teleport.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

Yes, that wouldn't be a problem :-)

>README. Also note that at least HDDRIVER 7.9 is required in order for
>HDDRUTIL to support the creation of FAT32 partitions when partitioning.

That /would/ be - I've gone back to V7.71 because later (and some earlier)
versions have some problems with the way I like to work with my scanner. I only
switch it on when I need it, and since the ability to rescan the SCSI bus in
ScanX doesn't work for me, I'm in the habit of running SCSIDRV instead. I then
get crashes - with V7.71 this works perfectly.

HP printers are amongst the best supported printers as far as Ataru printer
drivers are concerned. However, Hugh does not tell us which program he's
intending to use, so it's not possible to give specific advice.

>and colour output are both fine, but I lack the software to tweak the
>alignment of the cartridge.

I've changed the cart in my 660C a few times, and the alignment has been spot-
on each time. Do we know if the printer stores any realignment info in internal
memory, or is the alignment set by the PC sending code generated by the
alignment utility each time a print job is sent?

Confusion aside, thanks for the updated version.

It's probably not worth updating the version on my web site now, as I'll
shortly be updating it with V1.20 - I'll make an announcement in here once it's
been finished.

I found this interesting auction on eBay Germany:
http://cgi.ebay.de/aw-cgi/eBayISAPI.dll?ViewItem&item=514658971
It is touted as a Synthax/Syntari, but the seller knows nothing, and neither
do I. Is it some kind of rack-mounted Atari ST? Looks really sexy, anyway. =)

--
En ligne avec Thor 2.6.

Amiga IFF (8SVX): This is the dominant [sound] format on the Commodore Amiga
platform. It can specify an arbitray sampling rate but ony supports mono 8-bit
sounds. It also supports a 2-to-1 lossy compression format which uses a unique
Fibonacci-delta compression algorithm.

>Very little, I've just installed it and disabled the boot-log... I'm also
>running a few apps ofcourse, but none that should cause any problems at
>OS-level.
You could try CHK_OFSL in the auto folder like Derryck suggested, but IIRC
this is not necessary anymore with newer versions of MagiC. The OS should
be aware of open files, and prevent deleting these in the first place.
I can hardly grasp the fact that MagiC doesn't run stable on a certain
batch of Falcons, but since deleting open files is not hardware related...

Cheers from Belgium
Dennis

Hi Dennis,
I never got a chance to check out QED properly, and I'm sure it does
what you say, but I think Everest v3.6e&#65533; also managed to support OLGA
in the way you describe.

Hi Julian,
System Solutions would seem to be the most obvious source - I'm out of date as to what other companies are still in existence as an alternative (TUS?). I think they were pretty expensive, though, the last time I heard. Of course, TOS 2.06 could be put in both machines - the fixes in 1.62 compared to 1.06 in the STe are trivial and are fixable with small PD patches.

Another alternative is replacing the OS in software by buying MagiC, which means there's no fiddling with hardware installation and you've always got the original TOS to fall back on. Just an idea...

g'day, no. changing to a 1.44 is not as easy. It requires overclocking the
floppy controller, and changing steprates. TUS make a module for 1.44, I
think System Solutions used to have one made by elco too. You do need a
drive that can be set to drive 0 as well. Most cheap PC drives are non
standard and are hard wired to drive 1.

> I also have an external single sided floppy drive - I have the same

Yes, you can just exchange the 720K with a 1.44M drive, after you find
way to get the new drive set to address zero (0), which might take moving
a jumper or moving a solder bridge.

The 1.44M will work as a 720K because it is still being given a 8 mHz
clock. If you want a 1.44M drive to work at 1.44M, it needs a 16 mHz
clock signal. That can get complicated.

I had the same problem with one particular email and Newsie 0.94. I use a
local ISP. I called them and asked if they could delete the offending
email, and after confirming I was who I said I was, they did. I haven't had
any trouble since.

The whole financial/economical argument has its place, but it's not
the only one. Otherwise, there wouldn't be other people (not just
Atarians) interested in creating open architecture PowerPC machines.

I just wish the POP crowd would quit waiting for IBM and get back
on track.

An interim update: I took the gadget to the Mac shop, and none of them had ever seen one, it isn't listed in their books, they can't get parts for it, they had no advice for me. So again, they didn't help me a bit, but at least (with an Apple bit in my hand) they were less snooty than prior occasions.

I'm thinking now of putting another connector on it, wiring the battery leads (8 AA cells - 12V), and using an external supply. That way I KNOW the polarity.

Which is why I'm waiting for a Falcon to turn up locally. There were
two nice Falcons but when there 200 odd miles away I'm not taking any
chances.

Well your using a newer version, so I am probably wrong. On pap gold
it is under the object menu, or something to that description. There
you can load in images crop them and insert them in your document. As
I say, I'm using an 0ld verison so I doubt that helps.

>That way I KNOW the polarity.

Hey I've had an idea. Connect one test lead to the negative connector
on the battery compartment, and test to see which one this leads to on
the power connector. I'd be very supprised if the negatives of the two
power sources weren't connected.

> > Shouldn't it also have "Bluetooth" capability?

That would be great for a laptop with a wireless mouse.
For most communications however it's dead slow. I saw an Epson
demonstration and had to laugh, they printed some ASCII text! Now what
if you want to print a picture? Instead of putting in a USB cable you
just stand next to the printer and wait half an hour before your picture
has been send.

Come on, a 11Mbit/s wireless card from Apple is just $99.
Take two and you've got a fast wireless network running all around the
house.

Bluetooth would be cool if you want style, like a wireless keyboard
running on solar energy. Or a wireless optical mouse that you can charge
on a dock when not using the computer. UMTS will soon give cellphone's
2Mbit/s everywhere in Europe. I don't think that any Organizer is going
to ship without it in the year 2004. The market is moving fast,
Bluetooth is will never gain mass acceptance as anything more than a
PS/2 mouseport.

Oh yeah did I tell you that 200Mbit/s FireWireLess is running reliable
in the testlab already?

I did use QED with either Amail or Newsie (cant remember which)for a bit
as its editor and did have problems with its OLGA support, hitting ctrl-Q
as was allowed gave no file..

Reverting to Everest cured this.

So what's wrong here? This has happened to several of us under varying conditions, but there must be something in common to all(or at least most) of them. Maybe if we can recall all the circumstances of each situation, we can come up with something for the programmer to look for.

In my own case, the offending letter actually originated from my own computer. I had written a short (fewer than 10 lines) reply to a letter from a listserv. It's been a while, but I think we were using Onelist at the time. This was before Onelist merged with egroups and was bought by Yahoo. I remember getting all my mail to be read offline, then going offline, reading it, writing my reply, and going back online to send it. I have Newsie set to delete my mail from the server when it gets it, so the copy of the reply from Onelist was the first thing in my server mailbox the next time I logged on.

Once again I tried to get my mail to read offline. This time Newsie read the first message OK, but bombed when it tried to update the inbox list. I don't remember the number of bombs for sure, but I think it was two. I tried it several times, getting the same result each time. I tried Get Selected Mail, but it bombed then, too. I checked the files containing the text of the message, and I believe all the text was there.

I could easily be wrong, but I've always thought something in the mail header triggered the problem. None of the others in the listserv reported any problems, including users of Windows, Linux, and iMac. I still had full use of my alternative POP server on Delphi.

What about the rest of you?

From: kirkman14@my-deja.com
Message-ID: <90ppbb$o2e$1@nnrp1.deja.com>
Source record: 53301

Thanks to Philippe Gerin for his wonderful Mac ST emulator! If you want to check it out, visit his website at http://users.skynet.be/sky39147/

I highly recommend NoSTalgia (and its cousin PowerST). Also, if you want to create "disk images" to use with NoSTalgia from your existing ST disks, you'll need the utility "Dust."

One note - Dust will NOT work with USB-equipped Macs (G3, G4, iMac, and iBook) unless you install the "USB Floppy Enabler v2.0". Apparently DUST makes some calls directly to the floppy controller chip used in the older Macs. This software fix reroutes those calls so that the USB drives work properly with software written for the old Macs.

Here is a link to download the Floppy Enabler:

Hello, everyone. I'm trying to find the program Fansi, written by Eric March. This was the *best* ANSI drawing software I ever saw for the ST, and better than a lot of the stuff on the PC. Unfortunately, I have *never* been able to find it in a shareware archive. My only copy of it was lost when my disk was corrupted a few years back..

I'm hoping somebody out there might have a copy or know where I could get one. If you do, could you please email me or reply here? Also any info on how to get in touch with Eric March would be appreciated..

Maybe it's something to do with Atari's long noted midi support on their computers, which was one of the many reasons they were superior to the amiga and the PC (to this day I know of no PC with a standard midi port, sodding adapter leads my arse (C;)

PC psu to ST plug. Given that you can get the plug to plug into your motherboard the colourcode wirings are thus:

PC Atari Voltage
Red Red +5v
Black Black Ground
Yellow Blue +12v

That should be easy enough to work out, if for some reason the colours are different on your psu (either atari side of pc side) both usually have the voltages written on the board.
If you want any more help e-mail me.

Basically you just need to make/buy some extensions for the ports you need, and replace the connector on the PSU. You might also need to hack the case a bit, the Falcon mobo is quite large...

Take a look at http://atari.nvg.org/gallery/falcon/falcon.html to see how I did it.

I'm looking for a very simple graphics program that works under GEM and on graphics cards. I don't need (or want) any fancy stuff, basically I just want D.E.G.A.S. Elite that runs under GEM and is capable of handling multiple windows. Does something like this exist? Nomatter where I look I can only find either super-fancy photo-editors or stuff that bypass GEM altogether.

I need this to make some simple illustrations, currently I'm using Microsoft Paint (yes, I said I want something simple...) for this. Actually, a clone for GEM would be nice...

Quite right, and I recommend an AT case with AT psu , but an ATX case with ATX psu will work, it's just that you have to remove the power switch and put a latching type in. You may have toi cut some metal back as well, as Jo said, for the rather large mobo. I recommend making the cables yourself, as it's sometimes difficult to track down ones that'll do the job. And the floppy drive cable may be too short... It does look better though.

As for keyboard you could use your old one in helf of the old case or but Qwertyx to use a PC mouse and keyboard. Available from ASP in the UK.

Be surprised. There appears to be a solid state switch, which
recognizes whether the batteries should be used or if a power pack
is connected. The leads from the connector both go to a largish
(by comparison with the other surface-mount parts) chip, and
nowhere else.

Hiya..

It strikes me that to get colour on SVGA, we just build the mono VGA adapter, but leav eoff grounding the mono detect ping and wire up the RGB pins directly instea dof the mono out.

OK, now the problem is the shifter is clocking out at the wrong frequency. We know the shifter can run faster (it does in mono mode) so why not just write a patch to reprogram the mono scan speeds into the shifter in colour mode??

I've recased a few Atari's in my time, adn my personal view is that you will need a lot of patience....One of mine is on my website at www.c5.cybes.org if you go to the <About Me> section...th rest of it is about a charity C5 run I'm doing next year....

I tend to use really big old 286 desktops as a souce for the host. Dump the PSU and get a normal AT one, in my case it gave me enough room to get the Falcon in with all its shielding, and there's space at the side to access the dongle port if needs be (I've got a Wizztronics cart-right) if I can ever be bothered to attach my scanner permanently....I left the floppy in its normal place and cut an access hole in the case to save on the front 5.25" bays....the lower one is partially obstructed by the motherboard, so it's not easy to use, but there are two more bays internally.... they need special rail-things but I made them up out of some plastic, and you can find them at PC fairs easily enough.....I'm about to replace the CDROM drive with a Panasonic PD650 drive....

You get a choice, either cut a big strip out of the back of the case to access the ports or build extenders for everything you want to get at....mine accesses the serial and parallel, and the video output is permanently wired to VGA....., the speakers are a little kit that comes in a 5.25" bay mount and aren't bad for multi-media jobbies, there's a 4" woofer in there as well as the little pair......sound OK if you're up close.....

I've also got a tower that I'm about to try and redo my other Flaocn with, either that or my TT....

Hello

After breaking my STFM (which by the way is now repaired), I have just picked up the following items from the same auction:

An SM124 monitor, working, for £1.
A 520ST for 50p (not an STFM, the small 520ST with no internal floppy, PSU etc).

Which leads me to my question: the 520ST has no PSU. Where can I get one from, or with the pinouts, can I use a PC unit? I can see it's a standard 7-pin DIN socket I'll need. Also, can I use my external Power Computing floppy as a drive A, or does it need to be an Atari unit?

Thanks for any help anyone can give me....

Alex Taylor.

This rather underestimates the problem.

Lets do some basic math:

ST uses 32 MHz oscillator, which drives video shifter.
Shifter divides that by 2 and gives 16 MHz to the rest of computer.
GLUE divides 16 MHz by 2 and gets 8 MHz to the CPU.
CPU uses 4 cycles for access to the memory (without waitstates). 1 cycle of
8 MHz clk takes 125 ns, so four take 500 ns. This also means that teoretical
limit
for CPU is 2.000.000 transfers per second.
Designers of ST took cleverly advantage of the fact that execution times for
most
instructions on 68000 is even. That means that if enabled 0WS work, the CPU
would
almost always started memory transfer at 2n cycle.
Why is that important ?
Well, in computer two devices eat majority of memory bandwidth: CPU and video
shifter.
Those two are major bandwidth loads. But the fact that they behave so
differently
complicates things even further. CPU needs fast access and is in general hardly
predictable- ie. one can't
predict time nor address of next access on the basis of previous (it is not 100%
truth, but lets leave it here), while
video shifter behaves very predictably, but it demands no waitstates and usually
quite high bandwidth.
All older machines with cacheless CPU (like 8086, 68000, IIRC80286 etc) had
suffered quite CPU performance impact due to videogeneration circuitry.
As said, 68000 uses mainly even cycles for starting memory access, or more

precisely said, time of bus inactivity is even number of cycles.
Those days mainstream DRAMs had acces times of 150ns and they demanded extra 120 ns after access to be able to catch breath (precharge) of air before next access could begin.

Creators of ST did two important things:

-they have managed to shorten memory cycle time from 270 ns (150ns+120ns) to 250 ns
-they have enabled the CPU access on 4 cycle boundaries

Between consecutive boundaries is 500ns, which means time for two memory accesses. Forst is for CPU/DMA etc, while second is for video shifter. This means that video generating circuitry on ST can grab picture from memory at rate of up to 2MHz x 2bytes/access= 4Mbytes/second
When in monochrome mode, each access gets into shiter 16 pixels, so pixel clock is 16 x 2MHz=32 Mhz.
This means that each pixel lasts for 1/32MHz=31.25ns. Whole visible part of horizontal line takes 800 pix or 25 microseconds. Firts cca. 150 pix are black, 640 pixels are drawn from RAM and the last 160 pix are black.
There is also some extra time to accomodate beam retrace to starting position for next line, so each line takes cca. 28 microseconds.Since there are also top and bottom border, each picture frame has to have more than just 400 visible lines-more exactly 500. Top and bottom 50 lines are black or not drawn (during the vertical retrace)...
So, to draw a complete picture frame, video circuitry needs time for 500 lines. This means 500 x 28 microseconds=14 ms. Each picture frame takes cca 14 ms, so there are 72 frames per second.

This means that there is no way of convincing ordinary ST to draw a picture faster with equal resolution, border and retrace timings.

Similarly, in 4 colour mode one can reach only half as much pixel per access as in mono mode, so that means that ordinary ST will never be able to work in colour modes with ordinary VGA at 640 x 400....
This is not a problem of convincing shifter to work in colour mode, it's deeper than that.

I'm sorry for the length of the mail, but I feel that too many people here do not understand basic math with video access which is needed if one wants to fiddle with overscans etc...

Regards,

Branko

awhile back, and Antmail was always able to see and delete the
offending emails. I always use Newsie, but I still keep Antmail
around just for that reason. Seems kinda silly to handle it this
way, but hey, it works. ;-)

No.I have not,although I used it for a long time before taking up
NEWSIE. I will load it back onto my Hard Disk just incase things go
wrong again.

I have got around the problem by contacting my ISP who deleted the
offending mails for me,took exactly 2 minutes from my first contact
with them until they cleared it for me.

>Lately.... with Newsie I have always been able to delete emails
>that "hang" while downloading, by using "get selected" and then
>clicking on "delete" for the problem emails.

"get selected" never works for me,maybe I have set it up wrongly.

>It would be good if we could somehow save the problem emails to
>see what they have in common so Newsie's programmer would know
>where to look for a fix.

From what others have said it would appear that we have all had
trouble when having mail from "Mind-It" (the net minder) or Egroups.

>Hope that helps,

It certainly helps to know that there are many Atarians out there
still offering a helping hand

I read about that in a newspaper article,
funnily enough. It mentions S-Club 7
member, Paul, in his "uber-trendy green
Atari T-shirt"

Atari T-shirts seem to be popular on
the club scene and with DJs.

>Yes, thanks for looking out Steve.

Thats what this group is all about matey.

>I have got a Forget-me-clock 2, like I've said before. Control Panal
>picks the time up correctly. Is it something to do with me running the
>year as 1990?

Your messages are stamped Y2K, i thought the system stamped these!!
Anyway..
I wouldnt have though the year would be relevant as it is a valid system
date, i.e. its not a pre-tos creation date.
Are you running any Y2K patches, if not why not.

<Thinking out loud mode>
Its possible that UVK is checking its date-stamp, realising your system
is running 10 years prior to its creation and alerting you in its brick
in the face helpfull way that summat is up.

This could be sorted by

A) Setting your clock right..
B) Re-stamping all of UVK's files to match your system era..

Please let me know the outcome, i'm intriuged.

Must be my ISP's server stamping them. That's the way it seems to go
for my emails.

>I wouldnt have though the year would be relevant as it is a valid system
>date, i.e. its not a pre-tos creation date.
>Are you running any Y2K patches, if not why not.

Err, I can run it without patches in whatever year up to 2028, IIRC
but I can't "set" the FMC. It has a special program that set's it,
and this only goes up to 1999. If I change the clock/date in control
panal, the FMC won't pick it up, and next time you turn the computer
on, it boots up in the old date.

><Thinking out loud mode>
>Its possible that UVK is checking its date-stamp, realising your system

I'm going to use the joys of Multitasking and do it right know.....

Right! Done!
Basically it compares the date that UVK was made to what date your
computer is set at, so changing the date to Y2K fixed trhe problem.

Now all I need is a patch for my FMC, that's if the old Dallas chip
inside it can handle Y2K....

Hi,

I saw an atari st bang in the middle of fatboyslims setup the other
day.

try www.emerchandise.com for atari t-shirts
they have the one which was recently worn on the movie road trip.
it's licenceed from atari interactive aswell, so no money to
hasbro which is a good thing

regards

pmac

Still at a very early point in development and still without a proper front end my Atari Web pages are now available. Keep an eye on them as there should be several updates per week.

All feedback, ideas and contributions of content are more than welcome. The more input I can get early on the better as I will be able to mold the content to that wanted by its users.

I hope to use these pages as a resource for rare items and Atari based information. Check them out and let me know what you think.

Mark. (www.atari.connectfree.co.uk)

> game ??

The game was called Taipan, and possibly by Ocean.

This program did have a minute little problem when it was first release!
The boot sector wasn't a standard 512 byte sector and didn't run on many
machines. Which may make running on an emulator a little harder!

>It looks like it would be very interesting. Comments anyone, please?

I've only used it to extract the strings from RSC files that I am translating (as it's easier than using Look'n See with the Hextractor module, which usually leaves sime rubbish and, most importantly, doesn't tell to which tree various strings belong). It is supposed to be possible to translate the strings in an ASCII editor and then write them back with RTR, but I am not sure what the limitations are regarding changes of string length, so I tend to use RSM or Interface to construct the English RSCs. The RTR.HYP could be more helpful than it is (there is only one page with a very skeletal description). I have tried to reimport a translation as described but couldn't get it to work. No doubt my fault as I have not done somwething, or done it wrong... :-(

How about Papillon V1? It was much simpler and smaller than later versions
(the program was packed and about 100KB big), and, as far as I could
see, quite regular GEM app. I believe it was available on FTP servers and
BBSes several years ago; at least I downloaded it from -somewhere- then
(maybe ComNet?). I still have that archive if it is any help to you.

Center is positive.

I got tired of messing with it, and wired a bench supply to a power pack plug with an amp-meter in series. The first attempt was wrong, but it appears there's a protection diode that prevents damage (good thing), so after a low current spike, it went to zero. Reversing the leads caused it to come right up.

Works great as both an audio CD player and a CD-ROM drive. I guess I will never use it as a photo-CD player, as Apple cannot provide me with the adapter cable, and there are no schematics to figure out the connector pinout. Oh, well.

I'm still happy!

Since so few people have seen this, I'll describe it: It is a squarish package with the circular door/CD holder that hinges out. The door has a back-lit LCD display for track, time, etc. The main unit plugs into the power adapter/SCSI circuit base such that it is inclined at about a 45 degree angle. Very cool. Very Apple-ish.

I've recently acquired a Migraph Hand Scanner. I have the hand unit and the board for the cartridge slot, but nothing else. There's a jack for a power supply(at least that's what it looks like), but no information about voltage or polarity. There's no manual or software.

How the heck do I use this thing? Is there some downloadable software somewhere? I have MVG, and there was supposed to be a scanner module for it, but I don't have it. I know the scanner was originally bundled with Touch-up, but I don't have that, either.

If you're replicating the ports, which you
must do to stand a chance of plugging in
any compatible peripherals, then it's easy.
Connect like-for-like (pin-out wise), and
if the PC doesn't have certain ports, buy
them (for example, the 13-pin DIN
monitor output) and mount them.

If you're talking about using the PC power
supply, that is also easy. Look at the
original ST's PSU and check the +5/12V
and GND markings (the latter are the
black wires in any case) and see which
traces they connect to on the ST motherboard,
then adapt the PC PSU to that.

I should soon be purchasing an STe, to allow me to use half the stuff my STfm can't, but at the moment I don't have room for an STe on the side amongst my VCR, PC, tv, STfm, record & cd decks. I plan on putting it in a midi tower case so it can then be stood either on top of or below my PC tower. Is it best to get a case and hack away at the back panel until I get access to all the ST's ports at the back, or to float it more central in the case and make cables to run to the back of the case? After that is there any way I can adapt my PC PS/2 mouse and serial keyboard so I can use them with both systems?

>his postal or e-mail adress ?

I forget alot of the details, but basicly he got a large number of
chips that he said were defective from a supply for making SST & GCR
boards, he then tried sueing the supplyer of the chips and lost the
lawsuit and ended up closing the company since he didn't have the
resources left after lawyers fees, etc to recover and build the ST
items. I also think one of his sons had got seriously injuryed for
sometime and he spent along time away from the company taking
care of him. I forget the details, I read a story about it somewhere
on the net I believe. I know when one of the guys I knew when I first
got into the ST's from the 8 bit line was a beta tester for the SST
board and the speed of them at the time was amazing.
On a mega 4 equipped with a SST board, it would boot, load pagestream
load a couple meg graphics file before a stacey latop would even be
done booting and starting to load pagestream.. yet, it was like $800 +
dollars for the basic board, 68030 CPU and alittle extra memory.

Too bad someone couldn't have bought the rights, etc from Dave and
repoducted them latter in the Atari's lifetime.

Mike

I did it because my IDE 3.5" 1.7gb haqrd drive was crammed in the
original case, and the extra load on the PSU (not forgetting the heat)
blew the two big caps up on my PSU, literally.

Well done. Most things should have a protection diode but you can
never tell.

I have a similar one. My AC adaptor supplied with the scanner gives
13V DC, 850mA. As far as polarity is concerned, the "inside" part of the
plug is "+", and the "outside" is "-".

> How the heck do I use this thing? Is there some downloadable software

I have also looked for some software for that scanner, but unfortunately
it seems only Touch-Up does work with this model. I may send it to you
if you want.

Just how did you enable Sting?? I think it has something to do with the
settings of the Sting cpx files. Try booting with no Sting cpx files and
then add one until you get to the one that causes the problem. You may just
want to d/l the Stig package and reload the CPX files from it onto your
hard drive and start over.

I had the same type of problem and the above worked for me.

From: Petr Sumbera <sumbera@volny.cz>
Message-ID: <90trhl$1o21$2@news.vol.cz>
Source record: 53211

Now you can register NED PLAYER simple by sending card of your town or country to author. There have to be your email (for sending registering code), your name and type of computer you are using. This opportunity is time limited until the end of year 2000 (decisive is date of sending). The normal shareware fee for NED PLAYER is 15 USD or equivalent.

Hi

What you've told me seems to be info on connecting a PC PSU to an STF/STFM/STE motherboard (which might be useful in future), but this is a 520ST, with a 7-pin DIN plug input on the back of the machine for the PSU to plug into. This machine also has its mouse port on the side and everything else in slightly different places.

I'd also like a new top casing since this one is very yellowed, but I bet they're a little hard to find....

Alex Taylor.

PC psu to ST plug. Given that you can get the plug to plug into your motherboard the colourcode wirings are thus:

PC Atari Voltage
Red Red +5v
Black Black Ground
Yellow Blue +12v

That should be easy enough to work out, if for some reason the colours are different on your psu (either atari side of pc side) both usually have the voltages written on the board.
If you want any more help e-mail me.

DjS

>problem.

So youve got the answer now.

>Now all I need is a patch for my FMC, that's if the old Dallas chip
>inside it can handle Y2K....

I'm sure there is software available that sets the FMC correctly, its just that this software doesnt read it correctly, whereas your system and hence everything else does!!

There was quite a discussion a while ago RE. the FMC card and there are various versions of the setting software.

Still, even if the RTC keeps time and you have to manually set the year with the control panel each boot that is better than a poke in the eye.

Also, a simple auto folder program could be written to add a number of years to the GEMDOS clock every boot time, the RTC is only read at boot and used to set the system clock to rights and is ignored from then on..

Kevin,

Let it go. Who cares about this. Ive never seen such a large group of people who let this bother them. If this worries you this much I will send you the gun and the bullet (maybe I should send more than one you may miss) just to blow your head off. Its only you people in the UK that worry about this. If you would stop and really look at all the sale messages you will see everyone does it not just us in the US. Get a grip and a life.

Don

>>which). I bought a copy last year from System Solutions.

>Arabesque Pro runs only in monochrome resolution and if I recall me well
>it doesn't like a multitasking system either.

That rung a bell so i just tested it, its running in the background at
the moment, in a res of 1184 x 880 in 256 colour. Screen redraws are
crap, but it does work.

Hi There,

I would like to get my hands on a couple of VME Ethernet cards for the Atari TT or STE, is there anyone who has a couple of these surplus to requirements?

Better than that does anyone know a UK retailer with a stock of them?

Also required on Mega bus Ethernet card, does anyone know where these can be found.

Julian

Yes, seeing as I have recenlty purchased a copy of Lattice C then it
would be possible, I could even do it in Metacomco Basic! I'm not
sure if the time reader in the auto folder can support Y2K, cos I
can't even get it to be /set/ in the Y2K. There is a site (page?)
dedicated to the Y2K problem on the net, so I'll have to do a google
search.

Thanks Steve,

Apple did Airport the Atari way, they hacked it to make it affordable for the avarage consumer. When the wireless Ethernet standard went from 2 to 11Mb/s they saw the solution to the infrared problems, they went to Lucent, took their PCMCIA card, removed all the PCMCIA stuff to create a cheap card and hid the wires in the housing of all new computers. Tada for just $99 any Mac could get wireless Ethernet, that was 1/3 of the common prize. And still today Apple's wireless products are usually half the price than the PC versions. However they are fully compatible. It's just that Apple calls it Airport and Compaq calls it something else, it's the same standard.

In Europe Apple looks a lot like Atari in the ST days. They capture the piece of consumer market, that doesn't buy the PC they use at their job, with feature complete machines. They are even going into the soundstudios again with Yamaha supported mLAN; MIDI and digital audio over FireWire. I'm sure it'll grab some attention when software comes out that uses the realtime scemes in the Mach kernel from the OpenBSD based Mac OS X system. Which comes out early next year, right at the time when Apple will ship CD-RW drives as standard on (hopefully all) models. I think that the next generation iMac is going a big hit in the music industry, I just hope that more of the cheap packages become available so that starting musicians can use the iMac too.

I mean it's fanless, fast, cheap and within a few months it will have an uncrashable OS and CD-RW standard, all that in one easy movable strong package. Rent a DV-CAM and you can even edit your first alternative video, all by yourself and without any extra hard- or software.

I'm now Beta testing Mac OS X and it's cool. The icons are 128*128 pixels and resize as if it were the menu of an action game. I mean I used to have porn slides that size when I was a kid and now it's a seamless part of the interface.

7002. Qdialer .46 released

Newsgroup: comp.sys.atari.st
Date: 2000-12-10 14:21:53 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a339181$1_2@athena.netset.com>
Source record: 53232

Qdialer (the dialer for STiK2) has been updated and released to
version .46. Full package and source are available on the STiK2 web site
http://www.netset.com/~baldrick/stik2.html

Changes include the following
Connection times can be logged (Compatible with COSTA)
Script files can be launched upon a successful connection
(ie lauch programs upon successful connection)
Window positions can be saved and reused.
A whole new Tools dialog system.
Many other patches and upgrades across the whole system.

Hopefully this addresses some of the concerns and wishes for this
program.

Note there are problems going on currently with this version and
Hades and certain hades MMU control utilities. Hopefully this will be
sorted out before long.

>
>DjS

I have heard of some people putting the ST motherboard in the case and then
running the cables out the back. Go to Mario Becrofts site. He has some
hardware to allow a ST to use a PC serial mouse and a PC keyboard. Then
just get the hardware to use a PC keyboard/mouse with both systems. We have
such a device at work that allows this.

7006. BoinkOut2 v. 2.0 released

Newsgroup: comp.sys.atari.st
Date: 2000-12-10 16:29:10 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a33af56_2@athena.netset.com>
Source record: 53236

BoinkOut2 version 2.0 has been released at the BoinkOut2 page.
http://www.netset.com/~baldrick/boinkout2.html

A lot of small patches from myself and a set of patches from
"Marvin" Bressler.

Changes:

Code now compiles under GCC as well.
A new magic Block effect "Gravity"
Scores are now longs, so Higher scores are possible.
Patches to AV system
Patches to shel_envrn() call (Web browser support)
Should run under SingleTOS again.

Also available on the BoinkOut2 page Snowman.img a seasonal backdrop for
BoinkOut2.

Hello.

recasing an ST or whatever.

If you rack the ST the mobo ports are available on the back and you can velcro a CD Rom or whatever on top, readily removeable if needed. The kit comes with a Mega keyboard.

OR......

If using a PC tower buy a new Atari Mega ST or Mega STE keyboard from Keychange and save all the hassle and expense of using none Atari parts.

You can also then use both PC and ST at the same time.

I've done a few of these jobs, why make more work when Atari has all the parts you need.

The keyboards are £25 each plus carriage or buy a box of 5 for £100 plus carriage

Barrie at Keychange.

Hello.

To retain some sort of authenticity appearance-wise why not use a Megafile case (of which I have a few empty ones) for your hard drive with a separate PSU

OR........

As I have done with my Mega 4, use a low line PSU in the Megafile case to power the mega, a hard drive and a CD rom, again in a megafile case, looks quite reasonable and saves all the hassle of using a PC case.

Barrie at Keychange.

Source record: 53240

Just to let you know that I have put my TT up on the web running the webserver Weblight. The TT is connected to my Win-95 pc via a 57600 bit/sek nullmodem cable. The pc is connected to the Internet via 500 kbit ADSL.

The adress is http://atari.mine.nu/ but the content is simply the same as my normal homepage. Also some pages are missing.

Everything runs under Geneva/Neodesk and STinG so responses may be rather slow if I am using the fileselector or so. Also I have no idea how stable this setup is if more than one user is connected at the same time. Should be interesting to see if the system is still up and running tomorrow morning!

It's a protocol (as the name implies) not a program. You can only
download the specifications of the protocol.
You'll need a program which works as a DHST server (eg Startmeup
http://www.snailshell.de/) and programs which support DHST (i.e. DHST
clients) such as CAB.

There is an announcement by the programmers that the development of Pixart 5 has been stopped and they plan to release it as freeware. The current homepage (www.pixart.de) is currently not uptodate. If you can't find a demo version of Pixart on one of the FTP servers I can send you a demo.

Pixart is a great program. It's easy to use and even supports WACOM graphic tablets. It can also convert pictures with a lot of dithering methods and handles GIF and JPEG.

Once upon a time <3a341d2d_2@news.telinco.net>, kevin dermott
<k@kevindermott.co.uk> grabbed chalk and scrawled:

>well it says on the bottle " Flash Gel TM " so it is obviously made in
>some American state

That's got to be the most facetious remark I've ever heard. Unless
you're trying to prove you don't even know that TM means trademark -
which is quite scary, really. Did they train you to use a computer by
giving you a reward when you pressed the right button?

Richard (No. Reg'd TM doesn't mean a bloke called Reg living in the
USA).

>great success with it in the past.

It may not be the same thing, but I had similar problems reformatting some free AOL (I think) trial sub disks (before they went CDROM). They just would not format with my usual FCopy. I can't remember quite how I did eventually format them - I believe it was with Kobold, but can't be sure. All I can guess is that they had something strange in the root sector. After all you can write-protect root sectors on a hard disk, so perhaps you can on floppies too???

Yes - my son's CB had a protection diode wired *across* the supply terminals, so incorrect connection blew the inline fuse in the lead to the car's supply! One way of doing it without the penalty of a voltage drop across the diode, I guess:-)

>
>Any advice would be appreciated.

That's going back a bit to the start of the ST:-) I don't suppose it's changed in V4.8. The 4.0 manual (doesn't your friend have this?) says:

PRINT PREVIEW: This feature of ST Writer lets you examine a formatted text file on your monitor screen prior to printing it. You can use Print preview at any time while creating or editing a file.

For a print preview, press [Esc] from the editor to return to the ST Writer menu, then select 'Print file'. At the prompt 'Enter *P*rinter', *D*isk, *S*creen, Spoo*l*er, press S for screen print. For directions to the next prompt 'Print whole document Y/N' see 'Print file' above. Next, ST Writer prints your formatted file to the screen, showing each page break with a dotted line across the screen width. To pause the screen print, press [Control+S], then press any key to resume the listing. Return to the ST Writer menu any time by pressing [Esc].

HTH.

I have used ST Writer in various versions since 1988. I use ST Writer elite 4.8 every day for everything - it is a great word-processor considering it is only 65k long. I even use it for drafting emails which I then transfer by disk to this pc for Netscape to send under Linux! I use it to edit text files transferred from other computers such as my TRS80 and Brother word processor, it just has the easiest replacement of odd and peculiar characters that I have ever found.

With 4.8, Press ESC, then Press P. Select with the mouse from the Options listed across the window

Printer Disk Screen Spooler

The full manual is on the ST Writer 4.8 disk.

This does work, and the strings are imported back into the resource without
truncation. However, the actual objects which contain the text aren't
modified which can have an unfortunate effect in popup or similar menus.

The latest version of RTR has the facility to export the text with angular
brackets ("[") marking the position of shortcut characters, which makes this
version much less painful to use than previous ones.

>only one page with a very skeletal description). I have tried to
>reimport a translation as described but couldn't get it to work. No
>doubt my fault as I have not done somwething, or done it wrong... :-(

Nothing to go wrong, export RTR, edit, import, save resource... done.

FWIW you can have IConnect and STinG loaded at the same time, using their respective dialers decides which one is used to dial the connection. The only bother with this system is that you have to use the right overlay for CAB; Olivier Booklage's can be used for either stack.

>Just how did you enable Sting?? I think it has something to do with the
>settings of the Sting cpx files. Try booting with no Sting cpx files and

It seems that you only need the serial.cpx from what I can make out from STiNG 1.26's hyp, thus leaving STinG to get on with activating itself as needed.

Aixit's (www.aixit.com IIRC) MagnumST board would take you up to around 12-14MB, no processor change as such, but you have to remove it from the motherboard and plug it into the adaptor. Also required is MagiC or TOS2.06 in the form of a chip to be plugged into the adaptor.

With development of STiK ongoing, can we look forward to another CAB.OVL?
Chief of my wishlist would be the a better way of browsing offline. At the
moment one has to load the dialer, or wait for the timeout to go to zero.

Funny you should ask. There should be a new one available before
the end of the week. The only concern I have is time limitations at the
moment. (ie I have meetings almost every night this week, so I won't be
able to get much done at home)

>Chief of my wishlist would be the a better way of browsing offline. At the
>moment one has to load the dialer, or wait for the timeout to go to zero.

Obviously not using STiK then ;) If you are then there is some
problem going on. I'll see if I can think of some quick trick to force the
OVL into thinking it's offline.

Yeah, I suppose I didn't make myself clear. You said STE, and only
the Mega version had VME. TT has VME as well. It's just that you
didn't say Mega STE.

MiNTnet and STiNG have drivers for the Riebl card, both are freely
available. Look for MiNTnet at http://www.freemint.de/, and STiNG at
http://dlanor.atari.org/ (I hope I remembered that URL correctly).

Btw. Linux and NetBSD also supports this card, but I have never tried
these on my TT.

Just to let you know, Weblight is still running after 24 hours of sometimes quite heavy traffic on my poor 57600 line. 3.5 MB of data has gone out without any need to restart the program. I have been writning some mail in Okami tonight while people have been using the webserver and there are some timeouts occuring now and then when Popwatch steels the only thread to wait for my pop3 server. Also some "Varning open connection" has occurd wich, I beleve, means the actual user can't log on any more?

I'm just about to do some expire, export and import now in Okami so I guess there will be more delays within Weblight.

Right now I'm busy writing an article on the subject for the Swedish mag
"Atarimagasinet". When ready I plan to put up a website on my local TT
explaining the methods I used. Unfortunately I have two daytime jobs as
well to take care off, so it may take some time. I will however post here
when the page is ready. In the meanwhile the "testpages" will probably be
online most of the time.

Hi Peter,

I assume you have tried RSC_TRAN from Vassilis Papathanassoiu:

http://users.otenet.gr/~papval/

Seems to simple and good to be true!!!!

I use Everest 3.2E and it doesn't seem to have a problem with any drag and
drop files and the Olga aspect works fine with CAB and HTM files but maybe
I'm missing out on the more complex functions you need, as I don't
understand them or realise that they exist even!

Hi Derek

Re the password problem, e-mail Zetnet admin, they'll reset it all for you. I actually use 2 Popwatch programs one for my e-mail address and the other for one of my daughters. For some reason hers suddenly stopped working because of the password, Z. reset and there have been no problems since.

Never had any problems with them and Popwatch, and I've been using it for nearly 3 years. In fact I can't remember ever having a stuck mail but I have had a couple of instances where something in an e-mail caused Popwatch to crash in which case I just bypassed the e-mail next time round and used Newsie to retrieve it.

the 1772 is fine as long as it is the 1772-02 model, the rest will cook
after a while. I suppose from Shiuming's point of view just use a heat
spreader and fan;-) From what I remember the biggest drama with dd's and
hd's is if you put Hdd's in a dd drive you will quickly destroy the disk as
the magnetic strength in a dd drive is a lot higher than a Hdd one. So you
just end up writing a mess after a while, I only use dd's as dd's and not
hdd's for this reason.

: > DD and HD disks, so they should work equally well.

Agreed. The difference is mostly in coercivity, and that is about 20%
different. That should be well within engineering tolerances. When I want
to use a disk at 1.44 meg, I poke a hole in the corner, if there isn't one
there already. When I want to use it as 720 K, I put tape over the hole.

Any disk problems I have had is due to buying used disks, some known to be
bad, and not to how they are formatted, or whether or not they have an
extra hole in the corner.

Bad sectors and a destroyed disk are different things, unless the
bad sector is in the FAT sectors. Disks do wear out, and what wears
out is the non-woven cloth dirt-catching liner. If there is a lump
in the glue holding it in, that high spot will make the disk flop
around as it rotates, and bounce on the heads, which then cannot
read it. There is always a lump in that glue.

: the 1772 is fine as long as it is the 1772-02 model, the rest will cook

1772-02-02 Picky picky picky.

Hidi ho friends and neighbors.

One or two of you may have noticed that the A-ONE Magazine website (http://www.AtariNews.Org) has been down since Saturday evening at about 10:30 eastern time.

I didn't want to post anything here until we knew more about the problem.

Well, it now seems that is was a simple misunderstanding between our provider and their connection to the 'net.

We fully expect to be up and running again by sometime tomorrow morning... again, eastern time.

Thank you for your patience.

Joe

From what I undestand the disk's actual material is thinner on an Hd disk
than a dd and that is why they fail.

>Thank you.

Lhz are Lharc files and you will need Lharc to decompress them.
Zip are Zip files and you will needs STZIP to decompress them on your ste or Winzip on a PC.
TOS file are either self extracting archives (just open them to decompress them) or normal program files which you open and run as any other PRG file, usually the only difference between a TOS and PRG progrm is that TOS program do not make use of GEM and so create thier own menus and windows if they are needed.

You can download these from the Essential Utility Software section of the Atari Hyperlink Launch pad at
http://www.geocities.com/SiliconValley/Bay/8745/

>Does the setup use that Sting Remote program on your page???

No! That program is only used if you dial in to your provider with STinG
and want to control the dialing while sitting at a pc connected via LAN.

>Simple little insight to get me going.. My tt just sits here now that
>I only have a cable modem. I've tried to get it connected via a null
>modem cable.. but with no luck.

In short three problems must be solved:

1.Get the pc to perform the same tricks as STinG can like using ip
masquearades and routing.

2. Use the dialup connection (DUN) on pc for LAN connection via
nullmodem. Drivers for this can be found at
http://www.kevin-wells.com/net/ . I have used "revision 4" now for a
couple of years.

3. Manage no. 1 above to work on the faked DUN connection. After some
digging I found NAT32 at http://www.nat32.com/ . The demo at there site
actually works much longer than 1 hour but after that will kill windows
if you exit the program. The registred version works very well.

On the Atari side it's very simple, just a very basic STinG setup with a
fixed 192.168.n.n adress and fixed dns-server. I normaly use ppp and
simply activate the port in the STinG cpx _after_ starting the dialup
window on the pc. The STinG dialer is _not_ used.

It's doubtful that you'll be seeing 2Mbps coming through that cell
phone anywhere for quite a long time. That 2Mbps is the theoretical
peak and you best chances of ever experiencing it are if the base
station is located 50 feet at the end of the hall and you're the only
chap on the network. With the advent of 802.11b running 11Mbps, it's
unlikely that anyone would install a cell site on their premises. In
reality you'll likely be seeing speeds of 100kbps or less. I can get
mobile data services faster than that today in the states with

Ricochets 128kbps wireless internet service based on MCDN, not UMTS.
Here's a few articles to that recount the above (this list could get
long if I posted everything I've collected, but you should get the idea
from the few that I'm listing)

The inventor of the cell phone Martin Cooper says 3G will offer 64kbps
at best.

http://www.sciam.com/2000/1000issue/1000kahney.html

3G referred to as "daft overhype", and anyone that thinks 1Mbps will be
coming through their
phone is referred to as a fool. FYI, the Register and thus the article
is from europe.

http://www.theregister.co.uk/content/5/13492.html

"The other problem with 3G is the self-same one that blighted WAP -
daft overhype. WAP was sold as the Internet on a phone, which it
plainly isn't. Hence its utter failure in consumer acceptance.

The 3G phones were hyped with the same sort of nonsense - video and
high-quality music. Some fools even claimed we'd be getting 1Mbps down
the phone. We won't get anywhere near that when the networks finally
arrive and if video is incorporated it will most likely be poor
quality. Operators will be telling us how great the technology actually
is, but one look at a bitty, tiny screen will have Joe Public scoffing
and sticking with his trusty old mobile (you know, the one that simply
does what it says it will)."

You said 3G will _really_ do 2Mbps. I think not, and I'm not alone.
Once again, the European
perspective.

http://www.thisismoney.com/20000827/nm19684.html

"But the claim that the networks will push data nearly two-thirds as
fast as digital TV delivers on cable is wrong. An Orange source
said: 'They said two mega-bits a second and it's rubbish. 'I doubt it
will be a fifth of that, even in test-beds, and in rural areas it will
probably be a twentieth.'"

Telcos admit fears over 3g licenses

"Telecoms operators have admitted that their £68bn investment in third-
generation (3G) mobile technology could end in "disaster" because
services won't live up to the hype. "

http://www.vnunet.com/News/1111797

Hello.

I have two TT s and PTC 1426 monitors for sale, in good working order.

Each TT has a 48mb hard drive and 2mb ST ram.

Price is £180 each per set, TT and monitor, plus carriage.

Barrie at Keychange.

MacOS 6.x somethng was the last version you coud run with it. Or
something in that range. It's been well over 5 years since I last used
mine.

As to where to find the OS. Go to apple. They have a large
number of older OS's available for free on their web site.

Dan Ackerman
aka baldrick@netset.com

I could be wrong about OS 6 running. Theat number just sticks out
in my head. Could be that was the first one that didn't run. Maybe
someone else can answer with what version they run (or ran)

I have the same problem and oddly enough it's my program. lol
It just started this about 2 or 3 weeks ago for me and funet.
As far as I can tell funet appears to be limiting connections.
Some servers don't allow connections that are very far away,
and perhaps funet has changed it's policy?

Generally, I have noticed that when I log in and my hostname appears
as digits to any irc server, more than likely it refuses me.
Lately I have been forced to use the one closest to me and
luckily that one works for me.

Hi
My copy of 1st Word Plus has finally ended its days and I didn't have a copy (thought I did!)

Does anyone know where I can download a copy?

I'm in the middle of transferring some old documents onto my PC. I'm using a converter to put it into wordperfect format which my PC can read. Unfortunately it loses a lot of the formatting which is a pain.

Any help much appreciated

Hi

This one's got me stumped.

I have AtariIRC with Stik 2. A few months ago, every time I tried to
connect to irc.funet.fi, I would get an unauthorised connection returned
as it tried to enable my nick. I then recently tried to use other
servers (eg irc.netcom.net.uk) but they all return the same problem.
I have the IRC bit properly done in the STik configuration files, so
what's going on? Everything else works fine, email, news, web etc.

Ive been running one at 16mhz and no problem's so far. Had a crap drive in
there and I thought it was the controller corruptind disks, but it was a
shitty sony drive, TEAC work fine. Incedently not all 02-02's will go to
16mhz, it has been said about 5% will fail..

Hi all,

I've just uploaded DDP Translations' RTR V1.20 resource and bubblegem help file to the web site (URL in sig - go to the DDP section). I've removed the translation of the earlier version.

RTR is a shareware utility to extract text from resource files - this version marks shortcuts in the exported file, and has facilities for word substitution.

Hi Julian

A warning, once you get used to multitasking, there's no going back;-)
Naes is basically the modern MultiTOS, it's a graphical frontend for
Mint. All you need to get a basic system going is Naes, it's delivered
with a Mint kernel. It's availlable from http://www.woller.com in
Germany. Don't know if there's any english store selling it, but it
comes with both english and german resource. Also there's Magic, but
since you've got a Falcon, I would say get Naes, Magic doesn't work
100 percent on all Falcon's.

Here is something else you can try with STiK2 and the servers.
Try turning off the identd services in AtarIRC. STiK2 has built in
routines and I have seen the 2 conflict before. IF that doesnt' work
there are 2 possibilities. The first is lp's suggestion that it's a ban
on the servers and to try a different server, the second is that there is
a configuration problem in STiK2 that is giving incorrect information that
the IRC server is not accepting in the identd response.

> source to make it all work?

MultiTOS is simply MiNT bundled with a multitasking version of GEM.
MultiTOS was the first real experiance I had with true multitasking
on my Atari, but beware, MultiTOS is slow.

Similarly, N.AES is a multitasking and very stable replacement
AES that along with MiNT gives you a solid multitasking system
and is faster than MultiTOS.

Then we have Geneva. Geneva can be used with or without MiNT.
Without MiNT Geneva provides co-operarive multitasking an
works well. With MiNT you have a full pre-emptive multitasking
system. I used Geneva for many months and I found it very easy
to use. I only stopped using Geneva when I found for some reason
my whole system would become flakey when on-line. - I never
did figure out why this happened.

Finally (well, in my list, there are others) we have Magic.
Magic has been around for a few years and is a complete OS
replacement for Atari comupters. While not as stable as MiNT,
Magic is a doddle to install and looks really good. This
is what I now use and at v6.1 it is very stable on my Hades.

Hope this helps.

Regards,

Ben Hills.

I assume that you want to run ordinary applications, in this case you
have three realistic options:

1. Geneva.
2. N.AES/MiNT.
3. MagiC.

Geneva is the smallest and perhaps most efficient option here. It's not
as advanced as N.AES/MiNT and MagiC, but OTOH it requires very little
memory and runs very well on all hardware. It's highly configurable,
and it's definitely your best option if you need to run older software.
The downside is that it lacks many of the more advanced features that
N.AES/MiNT and MagiC provides, most notably (to end users that is) is
the lack of fast and modern filesystems. It's also the slowest of
these, but don't let this scare you off, as the differences are minor.

N.AES/MiNT and MagiC are actually very similar if you look at basic
configurations. They both provide a highly enhanced GEMDOS and AES.
MagiC also has it's own VDI and (X)BIOS, these are usually replaced by
NVDI and other hardware drivers but will come in handy if you're low on
memory and have to omit them.

N.AES (and TOS and Geneva too) really needs NVDI to be usable, and
N.AES/MiNT use more memory than MagiC, so if you have 4Mb or less I'd
recommend MagiC. You should try before you buy with your Falcon though,
MagiC and Falcon doesn't mix in some cases.

N.AES/MiNT offers more to the advanced user, but whether you need this
depends on what you want to use your computers for. I suggest you take
a look at the following web-sites:

Geneva: http://www4.pair.com/gribnif/ There is a demo available

MagiC: http://magicos.de/ Demos are available for the Mac and PC
versions, I'm not sure about the Atari version.

N.AES: http://www.woller.com/ (little info, except some screenshots in
the GEM-TV section), http://www.freemint.de/ and
http://atari.nvg.org/n.aes/

I hope this was helpful.

You got it Lonny. That's exactly what's been happening to me, just as
you say about the digits. So does anyone know a good, reliable server
in England, preferably, in the SW? I tried netcom as I said above,
but still no go.

Interesting. Can you elaborate as to what might cause such
a thing to fail? Does having a static versus fixed IP effect
such things?

7088. Hades IDE saga ends at last

Newsgroup: comp.sys.atari.st
Date: 2000-12-13 16:47:38 UTC
From: Lonny Pursell <root@bright.net>
Message-ID: <Pine.MNT.4.10.10012131631210.90-100000@TT030>
Source record: 53183

Well, a month has gone by and now I have finally solved the IDE
problem. I purchased another IDE drive (TM2110AT), the exact
one Paul so kindly noted was in his machine. It was the only one
I could locate at a dealer of the 3 or 4 drives other owners
mentioned and it just passed a sector test via the HD Driver utility
program.

No strange boot errors or anything like that. If you have a
Hades and wish to purchase a "newer" drive, I suggest you
make sure you can return the drive if it don't work or take
your hades to the dealer and test it. If you connect the
drive and get a "spurious interrupt" error then don't buy
that one.

Medusa is aware of this problem.
Again I thank Paul and the others who noted their drive and
make/model numbers and tried to help me with HD tips.

Now I am one really happy camper! :-)

I'm technically the maintainer of the Atari 8-bit files over at
UMich. I had been neglectful of my duties for a while, but recently,
when I finally had time to go poke around, I discovered I'm no longer
able to log-in!

Does anyone know what's up with Umich?

FYI, my username was "kendric" and I had a Kerberos account (to be able
to get to the atari/8bit directory). At the time I got the account,
my e-mail address was "kendrick@zippy.sonoma.edu".

Thanks!

As an addition here, these aspects of Geneva *can* be updated by using the
newest Mint, Boxkite (or other fileselector supporting long filenames), and
a more modern desktop like Thing or Jinnee (requires WDIALOG). This combo
not only lets you use Pre-emptive multitasking instead of cooperative, it
lets you use just about any modern filesystem (FAT16, FAT32, Minix, etc),
and speeds up Geneva somewhat. There is also a program called "Speedup" for
Mint that can be used with this. From what I can gather, it takes some
amount of control over program priorities to get the fastest result. I've
found that Geneva/Mint/Thing/Boxkite could be a very viable alternative to
NAES and Magic, especially for those of us in the U.S. who don't have any
NAES distributors and find Magic a bit pricey.

If the FPU is doing its job twice as fast
then that means the CPU can send it twice
the amount of data, which is proportionally
twice as much time spent sending data
rather than doing its own processing
because in relative terms it has 50% less
clock cycles to work with. If you want
the full benefit of an accelerated FPU
without affecting the CPU's bandwidth
then the only solution is to accelerate
both equally.

I've noticed this as well and it appears that the server does a reverse
DNS look-up on all connections. If this look-up fails, the connection is
rejected.

>enhanced, I mean one that actually *worked*.)

The story appears to be rather odd.

The writers of the original ST Basic attempted to make it compatable with the then pc standard, GW Basic. Hence ST basic contained statements, such as DEF SEG, which made no sense at all on a 68000, and so were given very strange interpretations indeed on the ST.

When Metacombo rewrote the Basic for Atari, they eliminated DEF SEG, introduced a swag of new statements and made a few subtle changes to the syntax of others. The result was that, while very simple programs would work with both versions, anything that tried to do a bit of graphics could need quite a bit or modification.

Meanwhile others, and HiSoft in particular, had decided that they could do better while remaining essentially compatable with the original syntax. This left the Metacombo version on a limb for one could not easily use the HiSoft compiler with a Metacombo program.

GFA had no pretensions to GW compatability and thus was above all this rhubarb.

It was also unfortunate that, while fiddling with Basic, Atari never saw fit to fix the memory grabbing habits of Logo so that it was easy to use with versions of TOS later than 1.0. You can do some amazing things with Logo. It's not quite a full-blown Lisp, but it's close enough.

I don't think I'm feeling too well, I've seemed to lost my ability to
explain. :(

When I said only the Mega STE had VME, I meant that it was the only
ST in the ST range to have VME. Of course the TT has VME, but I was
correcting him as he only put STE, not *Mega* STE.

>Interesting. Can you elaborate as to what might cause such
>a thing to fail? Does having a static versus fixed IP effect
>such things?

I've no idea what causes it. I have a static IP when using Demon and
often get a refused connection when trying funet and MIRC (windows) or
KVirc (KDE/linux). On the other hand I have an eggdrop bot that
sometimes runs on the same machine and that can occasionally connect
even when my IRC client can't.

I also use Freeserve, on the occasions that Demon suffer network
problems, and still have some problems connecting to funet even though
Freeserve provides a dynamic IP address.

I've just tried it and neither my bot nor MIRC connects. It looks like
funet may be doing a RDNS lookup with a very short time-out on it. This
would explain why it's coming up with the IP address rather than the
name.

Another possible explanation is that funet have closed their server to
outside connections to prevent some DOS attacks, or other system abuse.
I think irc.u-net.com did the same a few months ago as I'm no longer
able to connect to them.

The FPU and CPU are not two different processors, the FPU is simply an extension of the CPU. So by speeding up the FPU, you basically speed up a part of the CPU. The CPU doesn't do anything when the FPU is active, it simply waits for the FPU to finish processing the current instruction. The CPU doesn't spend twice as much time sending data, in fact it use exactly the same amount of time. However, it only use half as much time waiting for the results, hence the CPU get's more time doing non-FPU operations.

> clock cycles to work with. If you want
> the full benefit of an accelerated FPU
> without affecting the CPU's bandwidth
> then the only solution is to accelerate
> both equally.

This is the best way, as it means that the CPU can fetch FPU instructions and data faster, thus feeding the FPU faster. But this is insignificant compared to double-clocking the FPU *when it comes to FPU operations*.

Btw. it doesn't matter if it's done proportionally or not. If you can speed the FPU by 100% and the bus/CPU by "only" 50%, you do this. It will always be faster than speeding by both 50%.

In theory the CT60 looks a lot better than the AB (and not only because of
the CPU), but real life experience shows that simple is often better ;-)
I've ordered a CT60 myself, when/if it arrives it will be interesting to
compare these two. I'm extremely satisfied with my AB, so the CT60 has a
lot to live up to.

I know I'm going to get flamed to heck for suggesting this (as I always do), but also think about the Tempest as another option for the original poster. I was in contact with Istari recently (as they're apparently the ones actually building the thing, not Cortex - please correct me if I'm wrong) and they seem to have the final version about ready to be produced. They just need to know if there is interest in it still (at least 20 people committed to buying it when it is released). Here are the specs:

1. PPC 603e CPU (up to 200MHz), which runs 680x0 software at about the same speed as up to a 100MHz 68060 (the "up to" means it will run at that speed with Nemesis or similar bus accelerator).
2. 2 SDRAM slots for up to 256Mb of fast RAM
3. dual processing with either the 68030 or other CPU replacement cards, such as Afterburner (and maybe CT60?).
4. Plug-n-play operation, with the option of soldering in a single wire for added Falcon compatibility.
5. Priced at about $300 US / 300 Euro / 199 UK Pounds.

See fmax.atari.org for more details.

This card should be faster, cheaper, and allow for better compatibility than the CT60 (from my own comparison of the specs), and allow people to make PPC ports of software, which will run even faster than the specs I quoted in #1! I'm quite impressed, personally, and look forward to this card (I hope I can afford either or both someday! :). I was told that there was a hardware supply problem, which has caused the hoped for addition of a USB port to not become a reality (which may be why they were taking longer than expected to produce the card?). However, this may be an additional add-on they'll make in the future.

All parentheses are my own interjections, and may not be 100% accurate, but the rest is taken from fmax and Cortex sites, as well as e-mail info I received. This card does seem to be a reality, despite what the nay-sayers have said, and isn't a Cortex vaporware rumor. I hope people will support this card, too! Both are equally viable accelerators that seem to be pretty high-powered stuff!

Hei all.
A query more than a problem. Recently I decided to order some
items from Amazon.co.uk . I found I was having trouble getting a stable
page, try as I might, with all the different adjustments I did with Draconis.
I still got stalled while trying to download the first page. I did have
some luck with my other software Wensuite3 but only so far. I have got
it working previously and with no problem until now. I have no problem
getting through with Lynx on my Linux which is a text browser. So any clues
to help would be grateful.

> both equally.

That sounds just downright wrong to me. It is not like the CPU
automatically transfer MORE data (relative to its own code) if the FPU
runs faster. The amount of data sent to the fpu does not vary, so to me
that means that the amount of data that acutally IS sent, will be send a
lot faster. Thus, FPU using apps will run faster, because less time is
spent waiting for FPU.

Hi, Bill. I know nothing about your special access, but I do know the Umich ftp address has been inactive for some time. The general public has access to files from the web site, http://www.umich.edu/~archive/atari

I've been to the ST files several times, and I remember a directory for the 8-bit somewhere on that page. Perhaps there is something there that will tell you who to contact.

If you've previously loaded the dialer then Dan's overlay is quite happy to
let you browse whatever pages CAB's got cached, but otherwise you have to
wait for a timeout. Olivier's overlay has a 3 button dialog which at least
allows you to tell it that you're offline.

Yes, I've tried fiddling with the settings in the default.cfg file :-)

7121. Zip drive puzzlement.

Newsgroup: comp.sys.atari.st

Message-ID: <hR7eCJAiyMO6EwkO@lovecraft.demon.co.uk>
Source record: 53100

Well, I finally got a second Zip drive, so I can move files from PC to Falcon.

'cept it doesn't seem to work properly. The external drive, I gave to the Falcon, and I know it was working properly before, the internal drive in the PC is new and seems to be working perfectly.

Any attempt to move files, either extracting or copying, results in various errors. STZip is reporting CRC and Compressed Data Stream errors, Kobold spews some German which I think is referring to sectors - depending on the format of the disc, it's either upset about the FAT, or something else.

I've tried formatting disks for DOS Compatible mode in HDDRIVER, but no joy, though the PC accepts them (which is doesn't with GEM/BGM), the copied files are no use.

Richard

Well I was getting this with AIRC 1.05. I've just up graded to 1.11 and
it works now. This is with Sting on a Falcon.

Mind you it doesn't work on my Mac IRC.

Chris

It wouldn't be the fact that you're using a zip disk from a SCSI unit
to an IDE one in the PC, surely not? You've seemed to have tried
everything else.

Maybe this has been asked in the past, but all the web sites mention
were for connecting an Atari to a PC via ethernet (I think) and with a
PC running Win95.

I wish to connect my ST to a PC (386 laptop) using the ST as the
internet connection. I'd like serial connection and software for the
PC, but STinG v1.15 and above refuse to work on my ST.

I've tried
Ghostlink but that's really out of date and DOS based. Problem with
that is that you can only access the PC's drives, not accessing the ST
drive from the PC side.

Hello,

With the recent update to our site www.atari-users.net, We now
have to move all our Atari links to our new portal system. It has been
a slow process.. we have no free time!

So..
If you have an Atari website, PLEASE visit www.atari-users.net and add
your page to our Links Engine. It would help out alot.

At the same time.. stop by www.atarinews.org to add your link too!

THANKS!

>everything else.

They're both SCSI. *shrugs* The only reason the internal one is in the
PC is that my Falcon has no space in the storage tower!

The files show up, and STZip tries to read them correctly.

The only other thing I can think of is the cable, ISTR there's a reason
for the odd Zip/SCSI cables on the external drives, though I'm sure it
really doesn't make a difference.

Richard

Hi Richard. One possibility is that the ZIP is not properly terminated.
Try switching it on (or off). If you have more devices on the SCSI
chain, only the last one must have termination on.

Salu2

Daniel.

I have been trying since day one, but weather, work, sleep, and other
factors got in the way. So far all the drives listed in machines
have been udma 33 (ata-3 or ata-4) I think. I have a theory
the hades does not like ATA-5, but unless someone else buys
such a drive and it fails it's purely a guess.

Hi Bob!

For some reason CixRead keeps crashing when I try a 'com' to your message, so I am trying it as a 'say.'

In message <3a354ade$0$173@news.zetnet.co.uk>, rking@zetnet.co.uk said:

>I assume you have tried RSC_TRAN from Vassilis Papathanassoiu:

Since it is dedicated to me and the rest of the DDP crew, yes of course. But it has similar problems to those mentioned by Derryck for RTR - you can't be sure any strings longer than the original will fit the objects. I prefer to see what I am doing as I do it, and so for me an RCS is a must so that I can adjust object sizes where necessary. I have used both Interface2 and RTR and find them easy to use for translations. (As I am not a programmer I would find constructing new RSCs difficult!)

I learned about hidden strings in some of the newer objects (like subframes) the hard way! So I prefer to hook out the strings with RTR and print them out, so I can be sure I haven't missed any. Before RTR I used the HEXtractor module of Look'n See, but with that you had to get rid of the binary rubbish and couldn't tell for sure which tree a string belonged to; with some revised/updated RSCs they are not necessarily in a logical order in the file! HEXtractor is still useful for strings in PRG/APPs, which often have a number of alerts in them - some even embedd tyhe RSC portion.

I have used a Hex editor for replacement as well, which is fine as long as the translation is no longer than the original. Even then it's sometimes difficult to centre a shorter text in a button, for instance. Thus 'Cancel' is one character shorter than 'Abbruch' and if you leave a space at the end the button looks lopsided. I usually move up the closing ']' and then put in a NULL rather than leaving a space. I don't know enough about RSC formats to know whether that is strictly necessary (all strings are NULL-terminated anyway, but I don't know what effect leaving a space before the NULL after the ']' would have.

Regards, /Peter/

Well, the PC one definitely isn't terminated, otherwise I wouldn't be
writing this ;)

The Falcon is arranged:

Falcon - terminated
SCSI-II to 25 pin to 'Zip' port on Zip drive, not terminated.
25 pin to SCSI-50 on tower case, with CD-ROM, SyQuest and HD. The HD is
terminated, as the last device on the chain.

So I don't think it's that, though I know Zips are very sensitive to
termination, being looked at funny, or the alignment of the planets.

I think I might have two drives with different alignments, or possibly,
Unzipping the files on the PC and copying to a Zip might work. Though
since it won't even let me copy, I doubt it.

My Falcon doesn't accept FAT32, either, which I thought was the same as
VFAT?

7135. A4 Scanners - revisited

Newsgroup: comp.sys.atari.st
Date: 2000-12-14 22:31:48 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <91bhok$s2q$1@news7.svr.pol.co.uk>
Source record: 53113

Thanks for all the advice regarding my last query regarding the UMAX 2200SU scanner I saw advertised at Jungle.com recently.

I think Dave Wade suggested going to HOMA Systems web site at:

www.magma.com/~nima/html/other/newsflas.htm

This is not correct! It should be:

www.magma.ca

Actually the American company site seems to specialise in a nice line of PCI extension boards - which are fully supported (I received an e-mail from their technical support team!).

Sandrine is a non-starter only the demo is available - unless anyone knows differently - it supports the UMAX 1220S. www.centek.fr - seems not to exist now. Note Centek has nothing to do with the Genius called CZUBA!!

This leaves GT-Look2 - which is available but not sure which of the Epson GT series scanners it supports? A look at the LOOT.com site gave two GT scanners a 7000 & 9500 - these could be too new? Or is the GT-Look software being updated by anyone??

I tried an e-mail to HOMA (homa@canada.com) not expecting any reply the website was only updated in April 99. I received a reply from Nima today! It seems he has a 2200U which he is testing at the moment as to what its behaviours are, he recommended getting my hands on a 1220S in the short term. Has anyone seen any in the UK?

I have also tried Systems Solutions and 16/32 Systems as to getting the Scan-X software or a.n.other scanner - both have nothing in at the moment. Cortex Design can supply the Scan-X software and a 2200SU (which they claim work together - even though Nima is "testing" at the moment), but the price of the 2200SU is 149UKP.

I shall keep looking for a scanner.

Thanks again

Neil :-)

> Falcon.
>
> 'cept it doesn't seem to work properly.

Try a couple of things and report back:
1) Move the disk to the Falcon and format as a BGM partition. Try to copy a text file to it. Try to read the file on the Falcon.

2) Use HDriver to create a dual partition. Copy a text file onto the disk using the Falcon. Change the disk to the PC and try to read the same file.

3) Delete the file using the Falcon. Change the disk to the PC and copy a text file onto the disk using the PC. Try to read the file on the PC.

4) Change the disk to the Falcon and try to read the file on the Falcon.

This will reveal both alignment and termination problems. The most likely culprit is termination. As you mentioned, although the rule is to terminate the chain ends only, breaking the rule is sometimes necessary.

Additional questions:

Does the Zip work when it's the only item attached to SCSI?
Does the tower work when the Zip's not attached?

Galen

Very nicely summarized, Jo.

Galen

P.S.: For what it's worth, I use Geneva, mostly without MiNT, but
occasionally with. Works great, less (memory) filling, but no long
file names.

Hi!

Have you tried Geneva with Mint (newest version), Boxkite or other long filename enabled file selector, and Thing or Jinnee (with WDIALOG)? It will run long filenames perfectly fine with this configuration, although it won't take up as little memory. I never use Geneva by itself anymore, as this setup gives me many more options. You can use Neodesk, too, although long filenames will appear as "FILE_N~1.EXT" instead of "File Names.1st.ext" They will still run correctly, though, and if you need to see the entire name or rename it, it can still be done with Boxkite.

I believe the 603e can be divided at most 6x, so with a 16Mhz Falcon,
you will likely get ~100MHz from the 603e, so the two cards should be
similar in speed unless you speed up the Falcon's bus.

> 2. 2 SDRAM slots for up to 256Mb of fast RAM
Same with both, I think.

> 3. dual processing with either the 68030 or other CPU replacement
> cards, such as Afterburner (and maybe CT60?).
Interestingly, same with both. Run a Tempest and CT60 at the same time?

> 4. Plug-n-play operation, with the option of soldering in a single
wire for added Falcon compatibility.
Same with both.

> 5. Priced at about $300 US / 300 Euro / 199 UK Pounds.
The CT60 will likely cost more, due to the very expensive 68060 chip
(anyone know a US site where they're sold?)

> This card should be faster, cheaper, and allow for better
> compatibility than the CT60.
This remains to be seen.

Personally, I'm on the purchase list for both and hope to keep both
running on my Falcon (which will have to be recased, of course). I
expect to see some solid reports from this group before paying out
money, however.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To make room for new stock, Bravo Sierra Computers is holding a YearEnd
Holiday Sale. Everything is 10%-30% off! Atari Orders for $50 and up
are 10% off, Orders $100 and up are 20% off and orders $150 and up are
30% off provided the customer claims the discount in E-Mail. This Sale
covers Atari Jaguar, 8-Bit & ST. This Sale does not cover Monitors.
Customer pays Shipping. So order now while supplies last. Get your free
Atari catalogs at: www.atari.benjamin.net or E-Mail atari@benjamin.net

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Hello, my name is Benjamin Smith. I'm a Collector & Jaguar Game Player.
With all my games to play, I have no one to play Games with on my Atari
Jaguar. I live in Portland, Oregon. USA and I'm looking for Atarians to
play Jaguar Games with. You don't necessarily have to have a Jaguar.
Most any Atari will do. I'm thinking of starting Atari meetings in
Portland. Focused on Gaming but still supporting any Ataris. Call Ben
anytime at (503)256-9974 or E-Mail:

e-mail: atari@benjamin.net

If I'm unable to answer, leave a message and I'll call you back.

GOOD NEWS!!

Joel Chadabe , original founder of Intelligent Music and now at EMF (Electronic Music Foundation) has made available the Atari "M" Docs in TXT Format. He sent them to me and they are now on my site on the M page as well as the download page!

http://sites.netscape.net/timconrardy/m.htm

It is only a 40K Zip. It expands into smaller txt files for each chapter. I was tempted to make it into one TXT file, but this way the chapters are seperated.

It's nice now having the Docs available.

I need an Atari Falcon, preferably with a hard drive and at least 4 megs of RAM, i'm in Kent in England, and I need to show some smarmy Amiga users and their souped-up A1200s what a real computer is. I will pay up to =K3200, but only if I deem that what I am getting with the Falcon is worth the money, maybe more if it's really good kit.
A bog standard 4 mb RAM and 80mb HDD will do.

DjS

IMO, it should work. I have external SCSI ZIP's attached to my TT and my Hades, and an internal IDE on this Dell PC. HDDriver 7.54 on the TT, 6.22 on the Hades, Win98 with 32 bit FAT on the Dell. I have Geneva/Neodesk on the TT, Neodesk only on the Hades, and just plain old Win98 (:-/) on the Dell. The only time I had problems reading ZIP disks is when I improperly partitioned the ZIP disks for TOS and DOS compatibility using HDDriver 7.54. I simply forgot to check the TOS & DOS compatibility box in addition to the DOS check box.

I wouldn't think the heads would be misaligned. I would think you could test that by buying a brand new PC formatted ZIP and seeing if the internal will read and write to it with no problems. If it doesn't, the ZIP or it's installation has problems, such as a flaky ribbon cable.

Maybe the problem is ST ZIP. There was a thread a while back that talked about problems with large files. I also thought 2.6 was the last ST ZIP, but I got the impression there was a German 3.?. You might try some of the other Atari programs that ZIP files and see what happens here. If ST ZIP doesn't unzipped a file, and the other program does.... <G>

Just my thoughts.

Just to clarify:

It's actually only 1 SO-DIMM slot but there are large SO-DIMMS out
there. The memory-limit is basically only the size of the SD-DIMM you
put in there.

The PPC in the Tempest is clocked using cascaded PLLs. The first one makes the SDRAM memory clock and then the memory clock is used as an input to the CPU PLLs. You can get the full 200MHz (and even beyond that) with a standard non-overclocked Falcon. No bus overclocking is needed at all.

Just a quick note to say that I've finally been able to access comp.sys.atari.st. It's been a while!

Ever since my pay-for-use "Atari friendly" ISP disappeared, I've not been able to get online at all with my Falcon. Fortunately, I've recently built myself a new PC, and since I more or less refuse to pay for a dial up ISP these days (with all the good free ones available for the PC/MAC), I made use of a free/public news server, and here I am - using the excellent "Free Agent" software (I hope it's wrapping the text correctly - I'm still learning it)..

My Falcon is alive and well - although my new PIII 800/256MB handles all my Internet and e-mailing chores these days. The Falcon is now located in my studio, happily running CAF and burning CDs with CD Writer Suite.

My web site is still up and running, with a large Atari section - although I still need to do some massive updates to the download page!

Anyway, it's great to be back and catching up on all the Atari-related talk!

Works and looks fine. Includes language disk, mouse, & power cord. $19.95 plus freight. Add just $10 more and get the matching Atari SC1224 Color Monitor. Prices above plus freight. All products work fine. Mouse a little jerky but could probably be cleaned to make work better. Also have other product for sale like the SF Floppy Drive if interested.

7164. FS: Atari SC1224 Color Monitor only $17

The official English Poll, which will determine the fate of the "XTOS"
Project by Medusa Computer Systems/switzerlandhe is now online at

http://magicos.de/survey.html

The Developers are coming along nicely, so the only main hurdle to get over
is the 500 willing buyers.

The German version can be found on the official homepage:

http://www.xtos.de

--
Other MagiC Online (http://magicos.de) Site news:
The st-computer articles, translated by Jens Hatlak, are now available on
MagiC Online, as the official st-computer homepage no longer has an English
section.

The entire Links.atari.org pages by Benjamin Kirchheim have been updated on
both the links.atari.org webpages and the mirror on MagiC Online.

If you want to do that then you need a souped-up Falcon. I think you can expect to pay more than £200. Tell you what, you can hire my machine for £50 per day.

The souping up starts and pretty much ends with the 040 CPU and the Picasso 2
VGA gfx card, a falcon should keep up with that pretty much, and should blow
them away with sound.
I'm a musician and I've wanted a Falcon since '94 unfortunately as I was about
13 I couldn't afford one, now I can so I want one badly.

Yuck, Bill, that kind of sucks, doesn't it?

I'm glad to see you're still in the scene. I wondered what had happened to you. I had been following Newbreed prior to my current job, and now that I've found a free news server to connect to, I'm glad to see you're still around. I'm still having fun with Gemdrop, and the Atari community is forever indebted to your 8-bit skills.

It's been a fun ride -- let's make it last.

7171. FS: ST Monitor switchbox?

Newsgroup: comp.sys.atari.st
Date: 2000-12-16 04:58:45 UTC
From: Dan Mowczan <pinball@home.com>
Message-ID: <B66060B6.156C3%pinball@home.com>
Source record: 53002

Hello,

I have in my posession a Data Spec a/b switchbox for ST monitors (or so it appears). It has a COM, A, and B 13-pin DIN connector of the Atari ST Monitor type. Model DS-ATR-1302.

It also has a RCA Jack and a 15-pin VGA connector on the back, which might have been installed aftermarket by the previous owner. It came with a Mega that I owned years ago that included both monitors, but I did not use it in my configuration.

Untested, best offer.

Hi there,

Dan wrote:
>
> Go and see http://www.xtos.de

> Looks great !

Siphoned though my poor German it appears little detail is finalised on the new machine. I visited www.magicos.de to see if any news had arrived. It had, but it appears as though we are being held to ransom! Medusa (the developers) want 500 'interested' people before they guarantee production. Thats almost tantamount to a ransom folks!!

After the failure of Milan II you'd think that Medusa would have learnt a lesson from the failure of others, and actually finalised a design and spec to the point where beta-machines could be seen working by Joe Public. 'Let the working machine wow the people, and then they'll buy it' is my theory. Sadly we have got them saying 'we've got this, but we'll only show you if 500 of you are interested...'

Also the survey/form on magicos.de asking our opinions on it is silly. Questions like 'what interfaces would you like?' are completely idiotic. Have Medusa not been paying attention to the computer world? Interface choice is pure and simple, in that the current standards in PC's are the ONLY way to go if the burgeoning cost of the final product is to be kept to a fair price. AGP x2/4, ATA/66/100 (E-IDE), PC100 DRAM, USB and that IEEE thingy (Firewire!, or mildwire as I call it!!) are my pick.

All should be bundled into a mid-tower case with standard 101 AT keyboard (they're cheap!), an IDE CD/DVD? drive, 10GB E-IDE disk, decent video card (ATI, Voodoo, GeForce, Matrox mid-range card WITH some form of developed 3D support as minumum), and a choice of 32/64/128MB RAM. A software bundle is necessary (my choice is Photoline, Papyrus, Texel, CAB, and other parts to suit the purchaser, as well as the OS of choice (MagiC/MiNT/N.AES etc...)

Without this level of machine I think alot of time and energy will be wasted on this thing. I'm not going to commit to saying 'yes' until a working machine, as close to final 'shelf' version as it can be, is seen working at a major Atari fair...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

PS. I'm not a natural sceptic, I can just see Medusa starting on
the wrong foot with this...I do hope they prove me wrong though...

7173. Tim's Christmas Cheer

Source record: 53004

Hello All

Just uploaded some Christmas Music to the Atari-Midi File section
created on Atari Comnputers of course! I even created an HTML page for
it.It's neat that I was able to create a web page right within the Egrp
page itself!(and it actually worked! :-)

No Algo-comp programs were used on these midi's...just stright playing
and arranging using Master Tracks pro , Cubase and KCS.
I tried a trick in Master Tracks pro where I first created the melody ,
then Looped it so it repeated, then played my other parts over
it.Worked well.They are GM compatable

http://www.egroups.com/files/atari-midi/Midi+Files/TIMIDI/Xmas/Xmas.htm

Would like any comments...but most of all to spread some Christmas
Cheer!

Merry Christmas!

From:

Tim

I'd strongly suggest that you concentrate on Nima's ScanX driver. It
supports the GDPS protocol, which means that you can scan directly into
programs which also support it such as Pixart, Calamus and others.

>download the specifications of the protocol.

Yeah I realise this now. Not having an English .HYP for SMU v8 (anyone?) I
didn't know how to enable this in my Start.set (I've got it now).

>You'll need a program which works as a DHST server (eg Startmeup
>http://www.snailshell.de/) and programs which support DHST (i.e. DHST
>clients) such as CAB.

Cab too? I have v2.7e, do I need v2.8 to use it? Or should I also install
an environment variable for this???

Cheers!

James

It's some kind of GFX card for the Amiga, needs an 040 board and expansion slots fitting, nothing standard like PCI, ISA, or even VLB. I thik it's called Zorro or something, not that impressive when you think a Falcon did VGA as standard so we don't need to ponce around with those sort of boards.

Hello All

And now to a subject other then Midi

I have a Falcon, and when I am not working on my midi stuff, I would
like to play a good Excellent Graphic Oriented game, preferably a Space
fly-around- shoot em up type game. Good sound too.

Can anyone point me to a Falcon-specific game (s) that are on the net
(freeware, shareware, postcardware, ect)that meets these requirments?

HEY...even us Atarian Midi-ists gotta shoot'em up in Space !! :-)

I've got one of those now, and I not at all impressed with some of the
software, especially Outlook Express for mail and news. Give me Newsie
or Okami any day :-))

I have got the free version of Free Agent, but I think you will find that
the commercial version offers some features you are likely to want. (I
can't remember what they are, but I know they come for free with Newsie.)

If like me you dislike OE, try Pegasus for e-mail. It's available for
free from somewhere. If you need the details e-mail me privately or I'll
get shouted at for going too far off-topic :-))

Cheers

Paul

Stardust.

When run on a Falcon the in-game music
is generated at a higher sample rate than
the STE, too. Apart from that it's also a
great game with excellent graphics and
sound and based in space.

Dave Bagget also did a Falcon version of his asteroids game. It
had nice graphics and sound. I know a version of it is available at the
old umich archives if no where else. I also think there were a bunch of
Falcon games released recently out of germany and some of them had a space
motif.

If you want a really stupid game with lame graphics then you can
try my old game Astropanic94 ;)

I've got one for my Falcon. It's a little box made by MIDIman called
the "MINI MACman Macintosh MIDI Interface". It gives you an extra
MIDI IN and OUT port, that's connected to the Falcon's LAN port. It
works, but it gave me some problems with the audio mixers in CAF that
I never did get fully worked out. This was caused - as far as I could
tell - by the LAN port driver that's needed to make the little box
work.

I'm curious how you got this setup stable. I've tried to run Geneva+Mint
several times and it's great until suddenly Mint puts out nasty
errormessages on the screen and it crasches very hard. The latest Mint
version I've tried is Freemint 1.14. Mabe the latest version is better
with Geneva?

Some hints with maybe a MINT.CNF would be great. I only have NVDI 4 here.
Could that be the reason why it crasches? I must admit I have not tried
to run without NVDI...

Boo!

So far, I'm waiting for Steinberg 24 from Simon, and an internal Falcon HD from Steve Stupple - I've lost your emails due to a rather ill-advised clean out, otherwise I wouldn't be posting!

I'm away for a while - so there's no panic. Just wondering what's happening, especially with the drive (though I know I wanted a bracket) because I don't want to see it delivered then sit in my porch for a couple of weeks ;)

That's all! To everyone on the Atari group, have a Merry Christmas or whatever is appropriate, and whilst I'll be around over the next week, I'll probably be lurking rather than posting.

news:3A312292.58A575B3@avtomatika.com...

: Lets do some basic math:

(Lotsa clever points snipped)

I believe that color on SVGA is possible, but not by messing wit
the source of the video generation. Instead one would need to
intercept the signals at the video shifter side (those digital
RRRGGGBBB) and feed them to a sequencer that would quadruple the
value of every pixel. The quadrupling would look something like
this:

Original video line (each letter is one pixel):

KSNSHDFKLD...

New double lines:

KKSSNNSSHHDDFFKKLLDD...
KKSSNNSSHHDDFFKKLLDD...

Each pixel has been repeated horizontally one extra time, and
then the entire line has also been repeated. Our 320*200 LOW
became a factual 640*400 on the output side of the sequencer.
But we still see only a 320*200 resolution on the screen. This
would allow for outputting twice as much data with the double
horizontal frequency (some 31KHz) during the same timeframe it
takes to draw one line in ordinary LOW mode. The vertical
frequency would likewise become doubled to 100Hz (120 Hz for
NTSC systems). The work of the ST is entirely unaffected.

A sequencer could be a PIC and some RAM, or possibly a list of
values in an EPROM. After the sequencer some D/A conversion
would be required, maybe modelled after the existing one in the
ST, a resistor net.

Ideally one would make the above a bit more complicated to
instead exactly fit the typical normal VGA sync expectations,
which would allow for the use of really inexpensive monitors
found at swapmeets etc. Taking this a bit futher would perhaps
allow for creating extended modes with software only?

Hey there,
Basically you can use any 2.5 inch IDE drive on the Falcon
as long as the partition size is not bigger than, was it 1GB? You can also
use a bigger 3.5 inch drive with an 2.5 -> 3.5 inch adaptor. The port is IDE
only. If you want to use SCSI use the external port.

-> DOITF030

Any 2.5" IDE internal. Partition size is 1GB with TOS 4.04
Size of the hd is 2, 4, 6 or more. MagiC allows bigger partitions sizes.

Use an 6GB device here, splitted in 1 TOS and 4 BGM partitions.

7200. Version 14.50 of Westfront PC released

Newsgroup: comp.sys.atari.st
Date: 2000-12-17 06:53:29 UTC
From: pap3@dana.ucc.nau.edu
Message-ID: <91hnt9$1o5$7@usenet.nau.edu>
Source record: 53032

Subj: Westfront PC Version 14.50 released

Hello,

Version 14.50 of Westfront PC: The Trials of Guilder has just
been released. Improvements include:

o - New holiday additions (falling snow)
o - Quests are now updated (more consistency)
o - Several more rooms can now have contents in desc. examined
o - Room total stable at 1,578 rooms and 3 continents
o - Quests are stable at 45, with over 50 unique puzzles
o - Several cosmetic changes made to gameplay and interface
o - Help and documentation has been vastly improved
o - Saved game editor included
o - Inventory total extended to maximum of 18 items (from 16)
o - Bag total extended to maximum of 8 items (from 6)
o - Hover total extended to maximum of 18 items (from 14)

URL: http://www.geocities.com/dunric/westfront.html
Filesize: 933KB (for Windows 95/98/NT/Me/2000...An MS-DOS version is
available upon request)

Characters from versions as early as 0.47 (1997) can be
played on the current version of Westfront PC: The Trials of Guilder.

Versions of "Westfront PC: The Trials of Guilder" for Macintosh,
Unix/Linux, Amiga, Commodore 64, Atari, Apple II and Sinclair/ZX Spectrum
are currently being worked on/considered (Westfront PC was originally
coded on my old Commodore 64 in 1993). The setting for the game was Oslo,
Norway.

If you'd like to play the Windows 95/98/NT/2000/Me version of "Westfront
PC: The Trials of Guilder", please visit my website here:

http://www.geocities.com/dunric/westfront.html

The game was released into the Public Domain on August 3, 2000.

If you have any questions on Westfront PC, please contact me:

dunric@yahoo.com

I can also be reached through ICQ at the UIN#: 12234336

Finally, for those seeking help on gameplay, please read
the included Winhelp file "WFPC.HLP" before playing for the
first time. You may also visit the following web pages for

additional help information:

http://www.geocities.com/dunric/westfront.html
http://www.geocities.com/dunric/tips.html
http://www.geocities.com/dunric/maps.html
http://forums.topresult.com/dunric/wwwboard.sht

Thanks! Have fun! :)

Regards,

Paul Panks (a/k/a "Dunric")
Author of "Westfront PC: The Trials of Guilder" (and other games)

Hi Artur,

Several years ago, I tried putting a Western Digital IDE 2.5" in
my Falcon, but despite my trying everything on my ICD utilities
disk, I could not get the Falcon to see it. So I asked Tom Harker
at ICD if he had any ideas, and he said:

"You cannot use IBM or WD IDE hard drives with the Falcon. Try
"Quantum or Seagate. I have had good success with the Quantum
"Europa series 2.5 inch IDE drives and the Falcon.
"
"It is a problem in the timing of the command frames that makes
"them not work with the Falcon.

I also asked Chris Crowchuck(?) at Computer Direct, and he said:

"With the IBM drives, they report wrong sector and interleaving
"etc. under HD Driver. You can set these settings yourself and
"have HD Driver create a boot sector that should work. You are
"best to avoid IBM and Western Digital though for sure.
"
"We have had success with the Maxtor, Seagate, Fujitsu and
"Quantum drives.

I'm now using a 1.08 gig Toshiba 2.5" IDE drive in my Falcon.
Works great.

I don't know if that helps, but at least I can now feel good
about saving all those emails from different companies. ;-)

Best regards,

Clayton Murray

>

Yes, but there are some problems with that either.
I believe that some STs could spit even medium res on VGA monitor without
too much rework. Basically on ewould need TOS 2.06 within fast EPROMs (+ IDE interface
as an extra bonus while at it) and memory expanded to 4 Mb with modern 4 MB 60 or maybe even 70 ns
SIMM DRAM. Then one would have to replace main oscillator with 64 MHz and take care of old clocks for ACIAs,
sound chip, FDC etc- not too hard. Oh yes, CPU would have to be replaced with somehing a bit more modern and CMOS, like 68HC000FN20 or something like that.
Then he would have medium resthat could be overscanned nicely and still fit within VGA frame.Even low res would work, but it would have odd aspect ratio (320 x 400).
Monochrome mode would have too high frame rate for most small monitors, but should work on some 19"and bigger
(144 Hz is a bit high). But it could be nicely overscanned, maybe up to 1280x1024.
Everything else seems a bit too much work for little effect.

Your solution demands use of special hardware that would buffer whole lines, which could be come as complex as
redesigning of whole video circuitry from scratch. Besides that, if you circumwent shifter, how will you replace its color pallete ?
I think that some Amiga users can tell you that they had something like this for Amiga. They called it deinterlacer. Thing have had doubled every line from computer and has send picture to monitor at double line rate. But it wasn't cheap.

Regards,

Branko

Source record: 53037

With the power of G3 and 4 Macs why doesn't someone create an Atari OS the
works like OSX will, OSX will shell to the current Mac OS for classic programs
and it will run OSX as the native OS. Why cant someone make a powerful version
of STOS that is a modern and powerful OS that shells or emulates the original
Atari OS, I mean this would be cheaper then designing and selling
a whole new platform. Another idea is market the Atari platform to the video
game makers, with it's low end needs most new game councils could handle the
emulation. it would at least be better then using windows ce on the dreamcast
for some games. If it kicked enough but, a whole new
Atari MAchine could be as revolutionary if not more then the stuff from apple
which the PC market is all too quick to copy. Anyone scene Office 2000, looks
vary mack like to me with all the floating buttons.

Well Clayton, -

I had a very differend experiemce with a 4 GB IBM Travelstar HD in
a Falcon. It worked right out of the box, so to speak.
Plung it in, - run HD Driver program and your ready to compute again.

I had a similar nightmare when trying to link my zip plus 100 or zip SCSI 100 to my ST. I found after much pratting about that I _had_ to set the iOmega zip to id 4 and not 5, but also purchased a "very" short SCSI cable which seemed to stop the data corruption/ locking up while transferring files etc. Has worked ok since doing that but never got to the bottom of it. All id's were set differently (including internally set hard disk terminators and id's) but the zip drive would not run, or even be recognised on id5. Peter West said it maybe the host adapter - I have a link 97 - being set to 5 which is what I settled on! ;-)

Good luck.

Sean

I used to be able to connect to funet,swipnet etc. to use atariscne
using ic24 but now can't, even with the PC. I wonder if this is
anything to do with the Carol Vorderman's campaign to clean up
Internet chat So basically, you have to use a server where you can be
traced back to? So it's a ISP thing rather than just the IRC server
having an affect here....just a thought. Is it only UK residents
having this problem?

This could be due to termination errors or poor/faulty interconnect
cable. Note that Kobold only supports LFNs from V3.5 onwards, so that
may be the cause of the error messages, Just what do they say?

Recently fitted a 2gig drive to a Falcon, no problems except the mounting
holes were in different places, had to drill the bracket AND 'cos the drive
was too far back to fit, cut a piece out of the shield.

Barrie at Keychange.

Granted, it's not *100%* stable, but I seem to get fewer error messages with it than with Magic on my Falcon. I can generally use it without many problems. I also use an error catching program that traps and displays Mint errors in a dialog box. This may help.

> Some hints with maybe a MINT.CNF would be great. I only have NVDI 4 here.
> Could that be the reason why it crasches? I must admit I have not tried
> to run without NVDI...

I generally keep my MINT.CNF file very simple. It's basically just the MINT.CNF file that comes with Geneva, editted for file paths, etc. I can e-mail it to you, if you want it. Let me know. I'm using my iMac to post this, so I don't have the file on hand to post, otherwise I would. Don't know about what NVDI does to this setup...

NVDI 4.x is the best version to run under MiNT, as 5.x only works
correctly under MagiC. As long as NVDI.PRG is started before MiNT there
should be no problems whatsoever with it.

NVDI 5 also works fine with MiNT (I've been using it on my Falcon for ages
now), but printing only works properly under MagiC.

It had to happen, of course.

Trying to get the Zip drive to behave (I've managed to copy files, but they /still/ aren't unzipping properly. These are demos, X-MIX 1 through 3, so if anyone has managed to unzip them I'd like to know!).

Falcon crashes. Weirdly.

Now I have what appears to be a corrupted FAT, a directory that I can't delete and when allowed to be read, is all garbage.

I know you'll all say 'upgrade' because I'm still using Magic 5.1, but if the people who wrote Magic think they're getting /any/ of my money after the joke I'm beginning to consider their OS, they can think again! I don't consider bugfixes to be something that should be paid for.

So, do I need to repartition this disk and find a way of reconfiguring my system again? Or can it be saved?

Richard

I just bought myself a nice Nokia seventeen-incher (Valuegraph 417TV) at an auction. It's a rather nice screen, save for the much smaller screen area than my old Sony CPD-1730. The winning point about it, however, is the integrated TV receiver, so that one would be able to plug into the RF output of the ST for lo and med res, and use the HD15 plug for hires.

New Zip cable...

All working!

Well, X-MIX 1 and 2 crash (my machine gets the intro, then I hear SAM's
'bomb' sound), but they've copied and unzipped correctly.

I'm still annoyed at having to re-initialise a partition though.

Anyone in the USA have the following Atari ST games for sale or trade?

CAMPAIGN
CAMPAIGN MISSION DISK
POWERMONGER MISSION DISK (I've got the original game)
CIVILIZATION
HOLLYWOOD HUSTLER
TEAM YANKEE 1 and 2, and 3 if it was made.
DOG FIGHT by MICROPROSE

Must be original disks, manuals, copy protection materials if required.

I've lots of Atari ST/STe/Falcon Games for trade. Also will purchase.

North America folks only please.

Hi Peter!

P> Surely it's the other way round? The HD coating is
> higher coercivity to work properly with the closer
> spacing, so it would need a higher record current for
> HD disks...

I seem to recall that's only true for 5.25" diskettes (you may have made it clear earlier in the thread which size you are working with). Both 720Kb DSDD and 1.44Mb DSHD 3.5" diskettes have 80 tracks, but they have a different number of sectors. From memory...

5.25" Diskettes 3.5" Diskettes T = Tracks.
Frmt T S H Kb Frmt T S H Kb
~~~~ ~~ ~~ ~ ~~~~~ ~~~~ ~~ ~~ ~ ~~~~~ S = Sectors per
SSDD 40 9 1 180 SSDD 80 9 1 360 track.
DSDD 40 9 2 360 DSDD 80 9 2 720
SSQD 80 9 1 360 DSHD 80 18 2 1,440 H = Heads (sides).
DSQD 80 9 2 720
DSHD 80 15 2 1,200 Kb = 1,024 bytes.

..early PCs used 8 sectors per track, so a common 5.25" SSDD diskette held just 160Kb. I don't know how much of this applies to the atari 8-bits, but I understand early ST models had a SSDD 3.5" drive, later ones a DSDD 3.5" drive and I think most TTs (and possibly the Mega STE?) a DSHD 3.5" drive. I don't remember much about 5.25" hard sector or 8" diskette drives, except that they hurt when you drop them on your foot. E&OE YMMV.

Regards,
- Andy.

7240. Partition limits in TOS?

Newsgroup: comp.sys.atari.st
Date: 2000-12-18 06:41:50 UTC
From: ab616@chebucto.ns.ca
Message-ID: <91kbjeglj1@News.Dal.Ca>
Source record: 53072

Are there limits to the amount of partitions in TOS 2.06?

The reason I ask this is that a friend has 2 Mega ST4's (one has 2.06) and it will not read his Megafile 30 with the partitions contained on it whereas his other ST4 with a newer TOS (3?) sees the partitions and can access them. The Megafile, is located in the scsi chain, after a Metafile with 10 partitions on it.

Does TOS 2.06 have a limit on partitons (eg..10)?

Thanks...

7241. [PUB] New free site for musicians.

From: bixster@my-deja.com
Message-ID: <91lajoopm1@nnrp1.deja.com>
Source record: 53077

Hi Everyone...

I have many floppies containing tunes I sequenced years ago with SMPTETRACK. Although I still have my old ST sitting around, I no longer have a monitor, and although I know that the boot disk and dongle are around _somewhere_ I just don't have the time to cobble together the pieces to get SMPTETRAK up and running.

Does anyone know of a method to read SMPTETRACK files on a PC or Mac that would allow me to convert them the standard MIDI? This would save a lot of hassles. Thanks for any help....

Dennis

7251. Re: TT HD question

Newsgroup: comp.sys.atari.st
Date: 2000-12-18 17:19:04 UTC
From: Mark <mark@recycledsteel.co.uk>
Message-ID: <977160033.22657.0.nnrp-13.9e98a620@news.demon.co.uk>
Source record: 53082

My brother just got me a TT, unfortunately it was not packed that well and had basically been trampled on. The hard disk was DOA and so I just got hold of another SCSI drive and dropped it in.

It would appear that most drives work (I also used this SCSI hard disk on an ST with an External SCSI adaptor), I have also hard 2 different SCSI CD-ROM drives, a SyQuest thing and even an unbranded DAT drive.

You need to look out for....

ID (make sure other things on the chain are not the same)
Termination (both end need to be terminated)
Parity Check (needs to be off as far as I can tell)
Some kind of SCSI interface jumper I have had on some things (would appear to change the standard or compatibility, trail and error I found).

I have mixed success with different HD driver software, ICD has always work, early HDDriver is OK but I would say get the latest version if possible and AXHDI or whatever Atari made just did not work for me. Main problems I had was when re-partitioning, I think re-boots helped install driver software after a re-partitioning (may need to initialise or it could be my imagination).

Hope this helps.

Mark

Yo!, Dudes,

Is anyone else getting news server problems?. I started getting errors about 3 days ago, then reports that suggested my index files were shot, so i deleted them and all i got was a truck load old group tripe and a few new one's.

Whilst looking into it i discovered that bun.com and skynow.net have the same IP no's for their various servers. Is this because they use the same sources or are IP no's standardised in some way?.

Same for me here in the UK. Must have been some 2 months ago that
sometimes it wouldn't work with the unauthorized connection reporting.
I'd leave it for a few hours then it would work fine. This kept on
getting more frequent, until the point where it never lets me connect.

I've been trying to do some searches for some news on this subject but
didn't get long (something seems to be reporting "port not found", I
think it's Stik) but there is a site at http://www.ircnews.com , but
I'm not sure if that's any help at all.

You're not going to impress any 68040 Amiga
owners with any Falcon you can buy for £200.
Well maybe you can, it depends on how you
make it look. My Mega STE impressed the
pants off everyone at school, even PC, Amiga
and Acorn Archimedes owners. Being heavily
involved in art and design (and a friend's band,
which had 11 guitarists but no drummer, so I
used to program drum patterns in my soundtracker
and record them for backing tapes) at the time,
I did stuff on it that people never thought of doing
on a home computer. The spec didn't matter.

If you want to impress them with sound, keep
your eyes on New Beat's ACE DSP soft-synth.
It's really very good indeed. http://nb.atari.org

True. Medusa will need to write a 68k emulator/translator to
achieve 68k emulation. That isn't the best way to use to use
a Coldfire chip, but at 180MHz it should not be too bad. I just
hope they are up to the job of writing the 68k emulator/translator!

Kind regards,

Chris Wilkinson, Chistchurch, New Zealand.

> is the 500 willing buyers.

If 500 buyers is the only hurdle to get over then why aren't many specs
available. The survey is not entirely necessary also, because if Medusa
have any 'smarts' about them they will use current industry standards
etc...to keep the burgeoning cost down...and not worry about what we the
potential buyers (rightly or wrongly) think should be used in the new
machine...its common sense you see...

Also, what IS the likely cost of the XTOS machine going to be?

Without knowing WHAT I'm saying yes to buying, and not knowing
HOW MUCH I'm going to pay for WHAT, I'm not going to say 'yes'.

I think Medusa have a cheek to ask us to commit to something we
know freakin' nothing about...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>
> Aside from a case that is large enough, and a falcon, what else do I
> need?

Several things.

1. Some way of accessing the Falcon ports (printer/MIDI/serial/DSP etc...)
2. A new case for the keyboard unit.
3. A lot of sweat/tears/patience to fit it all together!

I hope to finish recasing mine soon. I'm building either a sheet alloy or galv panelled towercase, and the motherboard will be mounted on an angle (see below) to keep the tower height down. I'm refitting the keyboard into another home-designed case, and using RS-422 (LAN style) plugs to reconnect the keyboard/mous/joystick etc...

Internally the new PSU will power the m/b, a 1.2GB IDE disk, a 32X CD-ROM, and maybe an internal SCSI disk if I can get one cheap enough. Not sure about colours etc, but it won't be beige!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> have any 'smarts' about them they will use current industry standards

I suppose they want to get a feel of what it will take for Atari-fans to buy the machine. For example, a large number of people have demanded built-in midi ports as standard..
Once again, the specs are not available because they are not determined.. If everyone says, using the example above, that MIDI ports are of prime importance, that will effect both the cost of the machine and midi being built in. However detrimental you believe this method to be, this is the path that they have chosen.

> Also, what IS the likely cost of the XTOS machine going to be?

From what I know, the price will be a middle ground from the combination of what people are willing to pay (determined from survey) and the interfaces in demand.

> Without knowing WHAT I'm saying yes to buying, and not knowing
> HOW MUCH I'm going to pay for WHAT, I'm not going to say 'yes'.

Notice they are not asking "will you buy it: yes or no". They are asking what you would be willing to pay, and with what options that price you name includes (and just as important, what it does not include). The closest the poll comes to asking you if will buy the machine or not is the price field: If you will not buy it, you have the option of entering $0 :-)

Take care,
Bengy

7273. Misc ST items FS (USA)

Newsgroup: comp.sys.atari.st

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
440-286-2567 evenings EST. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows
3.1
Switch back and forth between TOS and DOS modes $90.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 as a stand alone fax machine.
Comes with special fax modem, diskettes, and manual. $30.00

R/C Aerochopper by Ambrosia Microcomputer Products.

This is a R/C Airplane and Helicopter Simulator for the ST.
A Futaba 2 channel controller that plugs into the ST's cartridge
port. With the 2 channel controller it's very realistic. $50.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $6.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk, box, and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Their Finest Hour (The Battle of Britian) by Lucasfilm Games.
A great flight combat game. This game is brand new and shrink
wrapped still. $15.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

MISC SOFTWARE

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual.
$3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

WARP 9 by Codehead Technologies. This is the famous screen
Accelerator for ST, STe, TT, and Falcon and this is the latest
version 3.80. Also included is the Extendo-O-Pak which includes
screen savers like the infamous flying toilets. Comes on 720K floppies
with manual. $5.00

Space Racer by Loriciels. Kind of like Wipeout for the Playstation.
Comes with disk, box, and docs. $5.00

BOOKS $5.00 each unless noted

Papa's Grafik Guide to AtariWorks Word Processor.
The ultimate AtariWorks Wordprocessing book. $5.00
Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

WANTED

MagiC Mac Ver 6.XX
CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,

OS/2, Mac, and Amiga. If interested please request a list.

Hi Dennis

There is a utility for PC called GEMEXPLORER (available on the Atari-
Midi File section...see sig) that allows you to read Atari Discs on a
PC. The problem still remains for you to have them converted to
standard midi files. The only way to do this is within SMPTE track
itself. However...if you can get the files into your PC using
GemExplorer, and ZIP them up, I will be happy to do the conversion for
you.

Where can you get these games? Are they shareware/Freeware..or
available?

I did find some games such as Moongames, some Asteroid clones as well
as the stardust demo. Looks like Stardust would fit the bill if I could
find the full version. Excellent sound on these as well. Sounds like
some of our present day techno-pop sounds like these Tracker
soundtracks. I really like the excellent colors and 3-D effects the
falcon brings!

Yes, all the "new" ideas from milan, medusa based on software emulation.

a emulation will be ever what it is, a emulation. Iï¿½m not shure if
anybody run older software on that systems. Good, better as nothing.

That smal marked need a better hardware. (in my humble opinion)

But..
Calamus 2000 on power mac G3/400 with magicmac need to load fractals.cdk
page4 in 32 seconds from UDMA66 10GB IDE unit.
What time -ANY- atari needs? (Some Minutes)? :-)

So what..? Itï¿½s only one example.
An emulation can be buyed from anydody imeditaly.
The name of is magic mac :)

We have to wait (what we do as long ;/) what medusa like to present
for a smal amount of atarians. I still hope it was realy more as milan
had to present last time..

Regards, Robert

7279. Reading ST floppies from a PC?

Newsgroup: comp.sys.atari.st
Date: 2000-12-19 06:48:37 UTC
From: Fritz-Ulrich Siewert <UlrichFritz@compuserve.de>
Message-ID: <91n10m$4kico$1@ID-48843.news.dfncis.de>
Source record: 52961

I can't read ST-formatted Floppies on my PC, and the Vgaread-Program
won't help.
Any suggestions?
I dislike the thought that I must copy everything onto PC-formatted
disks on the ST!

Thanks...

7280. Pure Energy disks

Newsgroup: comp.sys.atari.st

Message-ID: <3a3f2238.329864259@news.rrds.co.uk>
Source record: 52962

Hello!

Way back, I remember a group on the ST called "Pure Energy",
I think they did a few menus.

Anyone know of any websites which contain these menus or
screen shots from the menus?

I'm looking for the low numbered ones.

Cheers

baz

Hi

You don't have to.

I use a program called DC format 3 in which you can have the pc bit
written to the disk. Whats more it'll even allow for extended formatted
disk to be read and written via pc, yep you can use more space:)

The program is available from my LaST PD web site:

www.last-pd.co.uk

Great, does this work well?

Can I use this on my Falcon?

What OS are there drivers available for?
MiNT? Magic? MultiTOS?

What kind of ethernet is it? 100 BaseT?
ie CAT5 termination.
Is is 100/10 switchable?

What kind of data rates can you acheive?

Steve

Hmm... Maybe I'm thinking of the wrong part (maybe it's "Dragonball"),
but isn't Coldfire MOSTLY compatible with 68K? That they left out
some of the instructions? Which could be trapped and emulated?
That's a order of magnitude easier than a 68K emulator for, say,
Intel or PowerPC.

No. The dragonball has a real 68k core.

Yes, the code is similar, but IIRC, only one operand size (16 or 32 bits) is supported native, everything else needs to be emulated. Depending on the type of coldfire CPU (there are different architectures), emulation can be more or less hard.

Some of those thoughts crossed my mind as well. I am not so
sure it's just "Medusa" and I think directing comments soley
at them is jumping the gun just a bit. The Medusa site has
not changed at all and you would think if they were the driving
force behind it, something would appear there. At minimum
a link to the poll? I tried to read translations of the
german text and I got the impression someone else is building
this and Medusa is involved?

I would buy a new machine soley from Medusa, I've just don't it.
Personally I'd like more information as to it's origin before
drawing any real conclusions. If you look at Medusa's past
they just design a machine, put it out there, set a price and
if you can't afford it... well, you can't afford it. ;-)

So can someone provide more information as to the combined
efforts going into this machine? Bengy? You are hosting the
poll can we get the entire site translated?!

Motorola has a Coldfire development kit. In there is also a 68xxx CPU
emulator (even but - I am not sure - with on-the-fly recompilation).
Just as they made for the PCC CPU (Apple Mac).

I'm not disagreeing with any of this,
you just haven't quite understood what
I'm saying.

Yes, it will still take the same time to
send the data. Yes, it will get the results
back in half the time. However, if you
want to take advantage of that to
process 2x more FP data in the same
time (by consciously programming it to
do so - I'm not suggesting at all that it
automatically sends more data), then is
it not true that the CPU, unaccelerated,
spends twice as many of its clock cycles
sending data? That is, unless it is
proportionally accelerated, so it can
send the data *and* receive the answers
in half the time, thus enabling 2x more FP
data to be processed without reducing
the CPU's bandwidth.

> This is the best way, as it means that the CPU can fetch FPU instructions
> and data faster, thus feeding the FPU faster. But this is insignificant
> compared to double-clocking the FPU *when it comes to FPU operations*.

Again, I don't disagree.

According to the website, Elite 2 WILL be made PD, but this hasn't
occurred yet. They did state that the copyright owner has no intention
of going after anyone who provides non-commercial copies.

See http://www.frontier.co.uk/games/frontier/faq.html for more details.

I'm not sure but they may use supernews as their news server like
mine. Try resolving the IP number to find the name of it using one of
the utilities out there. Sting tools comes to mind.

I can't remember off-hand, but by logic
isn't a comparatively higher recording
flux more likely to mess up the finer
structure of the high density surface?

Apparently, it can... Look at:

http://www.moretonbay.com/coldfire/linux-coldfire.html

This is a special version of Linux --called ï¿½C Linux-- but it's Linux.

(The letter for "C" is the greek letter "mu", code 230 in "TOSCII".)

See you later,

> force behind it, something would appear there. At minimum
> a link to the poll?

Exactly, I told Ulrich (The Medusa "spokesman", who is organizing the whole fiasco) the very same thing. Even at this point, the public has heard no direct statement from Medusa. (I agree - kinda strange)

> So can someone provide more information as to the combined
> efforts going into this machine? Bengy? You are hosting the
> poll can we get the entire site translated?!

Well, the page has already been translated (The actual detail page that is - not the propaganda on the very first page :-)
It's on the DHS site: http://files.dhs.nu/text/medusa_coldfire_english.txt

> Personally I'd like more information as to it's origin before
> drawing any real conclusions. If you look at Medusa's past

Here is the origin (Highly condensed version):

Ulrich Gï¿½ssel (Released the shareware "Desktop 99") was at a point of changing platforms, but did not, like many of you, like Macs, pc's, or even Linux-based systems. So what did he do?
Well, he called Medusa and started discussing with them the idea of a new Atari clone - and apparently, they were quite encouraged by the idea because it was after the Milan II cancellation, and as he put it:

"there were hundreds of users ready to buy a new, powerful (TOS) computer: Their pockets loaded with money, but no machine to buy...."

So Ulrich convinced them to start designing this new computer, and offered to act as their "Spokesman" and conduct a poll, to make sure that the market is indeed strong enough for such a venture..

And that's that.. Any other questions? :-)

Take care,
Bengy

>but isn't Coldfire MOSTLY compatible with 68K? That they left out
>some of the instructions? Which could be trapped and emulated?
>That's a order of magnitude easier than a 68K emulator for, say,
>Intel or PowerPC.

On the site http://www.eetimes.com/story/OEG20001017S0041
all the details of the new Coldfire 4e can be found. Under
pressure from customers, next year the Coldfire will have a FPU, MMU, full
68k compatibility, DMA support etc... etc...
Will this be the type of Coldfire Medusa Systems want to put in
their new Atari clone ?

Cheers
Dan

7307. SCSI drive into a Mega STe?

Newsgroup: comp.sys.atari.st
Date: 2000-12-20 00:02:35 UTC
From: ag352@chebucto.ns.ca
Message-ID: <91osurbtq1@News.Dal.Ca>
Source record: 52989

I have this old IBM-made SCSI drive, a 160mB unit which must have come out of a Mac II or something along those lines.

What I'd really like to do is transplant it into a Mega STe which still has the original Atari-issued 42meg drive. RLL, or MFM or some jive like that.

Will I find the 50-pin connector in there? I assume that the Atari internal host adaptor combined with ICD's software will actually recognize the drive.

Your opinions please.

JG

Yes, it does, but in the same amount of time it also spends half the
amount of clock cycles waiting for the FPU.

> proportionally accelerated, so it can
> send the data *and* receive the answers
> in half the time, thus enabling 2x more FP

Only if you alter the code, but this can't usually be done so it's
completely irrelevant.

Yup, real plug and play. Just plug it in, format, partition, and set boot parameters. I think the only issue is with device ID and termination. Make sure it isnt terminated and is set to logical drive 0. The megaste does it's own termination and expects id0.

You surely aren't attempting this task yourself are you???

Wattage and voltage requirements will be low, as has been said before, it's
getting hold of the right sizes, ie 0805 etc, for the components that is the
important question IMO.

But if you want figures I'd guess at 1/8 Watt for the resistors and 25VDC for
the caps.

: Kind regards,

: Chris Wilkinson, Christchurch, New Zealand.
: /|\ ATARI Falcon030 owner.

: PS. I'm not a natural sceptic, I can just see Medusa starting on
: the wrong foot with this...I do hope they prove me wrong though...

I hope you took the time to answer the questionare.
Using the same retoric used here. Besides Medusa is the
first to produce an Atari clone an the only company to
produce 2 successful clones.

I seems that the Atari market maybe drying up in Europe.
My understanding was this page was meant to find programmers
to support this project.

Also, the chip they intend to use may have a restriction from the
manufaturer. They will only sell it in large volumes.
This is a way of stopping any small computer market by tight
control over needed resources. Thus you need a larger capital
expediture with the ability to recover this cost.

Promise to buy surveys help you to decide whether to take the risk.

I wish I had the money to give them.

Source record: 52899

Hi all,

> pressure from customers, next year the Coldfire will have a FPU, MMU, full
> 68k compatibility, DMA support etc... etc...

I'm sorry but that article is slightly incorrect. The only instruction set relevant changes to the 4e version of Coldfire according to Motorola are the addition of the FPU which is a new one derivered from the 060, the MMU which is a new one that is _not_ compatible with the ones found in 680x0, and some minor alterations to the core that won't increase the compability level of the Coldfire.

The Coldfire only implements longword versions of the arithmetic instruction of which quite a few has been left out of the instruction set. From version 3 and on the Coldfire can emulate some (but not all) of the instructions in the 68000 instruction set but this is done by intercepting the illegal instruction vector. As the machine code programmers out there can imagine the performance impact is tremendous. The net effect is that the processor appears to be running more than 4 times _slower_. Thus at best the 180 MHz part proposed would about as fast as a 45 MHz EC040, i.e. a 040 without a MMU or FPU.

However, the emulator distributed by Motorola only claims to emulate a subset of the 680x0 instructions. In practice, the emulator can only emulate a subset of the instructions that the 68000 can execute. A lot of 68020,68030,68040 and 68060 instructions can never be supported given the version 4 core as only the instruction word is checked for illegal instructions in that core. The adressing modes introduced in the 68020 uses additional words which are never sanity checked by the core. In essence this means that if you try to run 030 code on the Coldfire you won't get any illegal instruction exceptions. You won't be able to emulate the instruction by intercepting the exception and the Coldfire will execute the code incorrectly. Also, in order for the emulator to work you will need to heavily patch the OS or write a new version of it...

All of these problems made me switch from using a MCF6307 Coldfire in the Tempest to a PowerPC as although you will have to make a more clever just-in-time recompiler, the PowerPCs are more powerful. The resulting speed is higher. You could of course program a better jit recompiler similar to the one I've written for the PowerPC but that's not a trivial thing to do. It will take a lot of time and effort to do so.

The Coldfire is not intended as a direct replacement for 680x0 parts. Instead, it is intended for new designs where you can rewrite/recompile the code. For those, mostly embedded, designs where you can do that the

Coldfire's are absolutely great.

This became a bit technical but I'll make a summary:

* The version 4 of the Coldfire core can never be made to execute 030 code using the Motorola emulator.
* The Motorola emulator do not emulate all instructions used in Atari software. You will need to patch software.
* When emulating 680x0 code the Coldfire becomes, due to the emulation, more than 4 times _slower_. Hence, a 180 MHz part will appear to be running at approximately the same speed as a 45 MHz EC040, i.e., a 040 without FPU or MMU.
* The operating system, i.e, TOS will have to be heavily patched!

Best regards
Sven

The 500 minimum buyers they want is more than the total number of Milans sold
so far. And these *are* still being sold *now*.

Which one? The coldfire?

Motorola is selling these as controllers, not desktop CPUs, and they are
used in many applications - do you have any hints that they have blocked
companies trying to buy small quantities of them?

The last time I talked to a Motorola rep, he did not say anything about
special minimum quantities for coldfire CPUs.

I use CAB at home and have set up some secured sites in work. In the
past, CAB has been able to provide the username and password dialog
but for some reason always failed to authenticate properly and the dialog
keeps reappearing without allowing access.

I've just tried it again now and for some reason CAB now bombs when
trying to access a secured page!

Try it yourself to see what happens in your browser. Go to
http://admint.bangor.ac.uk and select any of the sites listed under
"Restricted Access". (I suggest the Card Enquiry or Prospectus
Enquiries ones).
Of course, you haven't got a valid username and
password, but at least you'll be able to ascertain whether your
browser actually works and asks you for a username.

However, sites that use server-side scripting coupled with HTML forms
to submit usernames and passwords should work OK, but I haven't got
any examples of those.

Nope, that helped.

I guess if anyone would prefer PPC they should indicate that
in the poll. So far myself, I am not so keen on the coldfire chip.
I also wish to avoid the mindset "well at least something is
happening", settling for anything just to get something is not
always a good move. I guess I'll fill out the poll and
leave it that. ;-)

I think PPC is the best way too. I first thought Coldfire was ideal,
but there is a lot of misleading texts out there. Also using the PPC
will path the way to a G3, will it not. The PPC is nearer to the G3
right?

May I take a step backwards?

When I last looked at the Motorola site, which must be over a year ago now, I convinced myself that the Coldfire series were never intended for use in a PC at all. Rather they are meant for imbedded microprocessor applications where it is impossible to have a 3hp fan keeping the beast cool, so that they push performance only as far as is compatable with heat generation. In fact I think that a year ago the 68060 still outperformed the hottest (or should that be coolest?) of the Coldfires.

What's the position now?

G3 *is* a PPC model nickname. It's the PPC 750. The G4 is PPC 7500, and you
could call the PPC 603(e) and 604 G2's, and the 601 a G1. They're all in the
PPC family.

And also, you must "disable unit attention at startup" if your IBM drive
has a jumper for that. I have a DSAS3540 IBM SCSI drive that did not want to
boot without an additional reset after power-up until that was reconfigured.
I have read that "disable unit attention at startup" is not needed
with TOS2.06. Anyway, it would be a good idea to find on the net the
docs for your drive so that functions of all jumpers are clear to you.

Hei Chris.

Recently I had trouble with Draconis bombing me, when accessing
amazon.co.uk. I eventually sussed my problem, but I use it for ordering
from amazon with no problem. I think the secured site problem may stem
from linking to https sites. this does trip up on certain software.
On Linux lynx web browser it has the same problem of access to https, but
with the lynx-ssl it's like knives through butter.

regards

Well folks, this is just to get the word out that there will be no official Atari chat being so close to the holidays, so have fun visiting friends and family, watching Christmas specials, and all that. Or visit with each other at:

http://stargate.cs.swau.edu/atari

Sorry I didn't get the word out sooner but I've had server problems with Southwestern Bells lately (how funny that it would be the service I pay for and not the non-profit BBS I actually use that would poop out.) :)

Anyway, take care, and we'll pick up again next week Thursday (December 28th) at 8pm CST to talk about all the Atari stuff we got right? Until then be safe, and let's see that we all make it through the holidays in one piece.

God bless,

Doctor Clu

I can't see how this can be done in real life. I mean, you have a specific algorithm to implement, and you can't shuffle around FPU-instructions just like that. Things has to be done in a specific order, that's why it's called an algorithm ;-)

7348. FS: TOS Chips/RAM Simm Modules

Newsgroup: comp.sys.atari.st
Date: 2000-12-21 16:25:25 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3a422ef6$0$77895$272ea4a1@news.execpc.com>
Source record: 52928

Hello,

I have for sale the following items:
==========
Atari Part# C101629 - ST/Mega U.S. TOS 1.2 1 Meg (Hi) ROM
Atari Part# C101630 - ST/Mega U.S. TOS 1.2 1 Meg (Lo) ROM

This two chip set came out of a Mega ST4. I upgraded to TOS 1.4
Price - $20.00 You pay shipping
U.S. dollars/cashiers check or money order
==========
Atari Part# C301163-002A - STE U.S. TOS 1.62 (RAINBOW) (Hi) 28 pin ROM
Atari Part# C301164-002A - STE U.S. TOS 1.62 (RAINBOW) (Lo) 28 pin ROM

This two chip set came out of a STE (not Mega). I don't even recall
booting the machine with this set. I bought the machine new, then
immediately upgraded it to TOS 2.06
Price - $30.00 You pay shipping
U.S. dollars/cashiers check or money order
==========
Four 256K Simm Modules - STE

These four modules came out of a STE (same as above - not Mega).
I don't even recall booting the machine with this set.
I bought the machine new, then upgraded it to 4 meg of RAM.
Price - $50.00 You pay shipping
U.S. dollars/cashiers check or money order
==========

If sincerely interested, email me at kjcat@execpc.com

Happy Holidays,

ken

Screw Linux...

7350. FS: Atari 1040ST (includes Atari Color Monitor) only $29.95 plus freight

Newsgroup: comp.sys.atari.st
Date: 2000-12-21 18:49:05 UTC
From: TJ <amishman@pacbell.net>
Message-ID: <B66790A1.2F88%amishman@pacbell.net>
Source record: 52930

The $29.95 plus freight includes the 1040ST, user manual, language disk, mouse, Atari SC1224 Color Monitor, SC1224 User Manual, monitor cable, power cords. All items look and work fine. Mouse a tad sticky but I would think a cleaning of the mouse ball would take care of that. All items tested and work fine. I also have the Atari SF354 External Floppy Drive for sale. The drive includes user manual, power adapter, and data cable. Add just $10 for the drive.

I am in California.

Tom

7357. Help for the newbie!

Newsgroup: comp.sys.atari.st
Date: 2000-12-21 19:05:31 UTC
From: mcardina@f1n06.kent.edu
Message-ID: <91tk9r$m04$1@usenet.kent.edu>
Source record: 52937

Hello all! Well let me start off by saying that I am fairly new to the ST line of computers. I have been an Atari enthusiast since the mid-80's. My first computer was an 800XL! That was the extent of my Atari computing. I bought an Amiga in 1989 and stuck with that until I bought a PC in 1995. (Please don't beat me profusely for that one! :))

I have recently aquired an Atari MegaST 2 with 4Meg of RAM and a 20Meg Supra Hard Disk. I am very interested in getting this machine up and running on the Internet. What do I need to do to make this possible? Is it even a feasable idea or should I try to find a Falcon or TT? How about a Medusa Board or a Milan? I have done some reading about these computers but I am afraid that I am a "lost sheep" when it comes to TOS. I like the computer very much and it seems fairly easy to use.

Let me know if anyone has any ideas or suggestions.

Thanks!

Mike

> Is it possible to use an Atari computer on WWW and access secured sites?

Rather poor option (and maybe not exactly what you're asking for) is
requesting web pages at https addresses via e-mail sent to a
web-by-mail server. www4mail supports this since recently by
version 2.4p4 running at www4mail@wm.ictp.trieste.it .
Form submission should be possible there, though reliability
seems to be low.

7359. Year End ATARI Sale! 10%-30% off!

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To make room for new stock, Bravo Sierra Computers is holding a YearEnd
Holiday Sale. Everything is 10%-30% off! Atari Orders for $50 and up
are 10% off, Orders $100 and up are 20% off and orders $150 and up are
30% off provided the customer claims the discount in E-Mail. This Sale
covers Atari Jaguar, 8-Bit & ST. This Sale does not cover Monitors.
Customer pays Shipping. So order now while supplies last. Get your free
Atari catalogs at: www.atari.benjamin.net or E-Mail atari@benjamin.net

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
bensmith@teleport.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

As far as ISO charactersets goes [ISO-8859-x], try Papyrus - the
demo is good enough for this purpose, the very Papyrus + NVDI can
make use of the larger TrueType fonts such as Cyberbit or MS Arial
Unicode so you should have no problem with Japanese. But should
your emails be in UTF-8 than so far there is no Atari-program
available [yet ;)].

Well, I am drawing a parallel to S-VHS v VHS videotape. To record at a higher carrier frequency = shorter wavelengths, they had to increase the coercivity of the tape. Higher coercivity needs a higher write (and erase) current. As an HD disk has twice the number of sectors per track, the equivalent of a shorter wavelength is needed. The difference in fringing from changing write current to a disk head should be negligible, I would have thought.

When I connect my Falcon to my Atari SC1224 color monitor and switch to
"high resolution" it switches to interlaced mode and the monitor
flickers too much, but when I switch back to non-interlaced mode then it
throws me back to medium resolution.
Is there any utility that would make the non-interlaced mode stay in
high resolution mode
on SC1224 monitor without throwing me back to med-resolution ?

Artur

>specs of
>the machine.
Hello,

So do I but the specs will be decided by us ! Once Medusa knows how many people are interested and what they want they will analyse the poll and then let us know on their site what we have decided. I guess afterwards they will contact everyone who participated in the poll and ask if you want to buy it. For sure is that it will be based on a 180 MHz Coldfire. I am sure more details will follow once Medusa knows how many people are interested.Medusa is a reliable company, they have already made two Atari clones long before anyone else had tried it. Read on Magic Online that until now only 43 Atarians have responded. There must be more in the world ! Do you want our platform to die ? Please respond.
(Responding to the poll will not force you to buy it !)
I read that there are already enough devellopers willing to participate. What is needed now are potential buyers. Will the project fail because of lack of interest ?

Cheers
Dan

7372. Atari FLH video format

Newsgroup: comp.sys.atari.st
Date: 2000-12-22 07:02:32 UTC
From: phantomm@eastky.net
Message-ID: <91uua8$9e$1@nd.eastky.net>
Source record: 52858

Does anyone reading this group know if the FLH Video Format like the one that Apex Media creates is an Atari only format, or is there a FLH video format on the PC and MAC platforms?

If PC and MAC does have an FLH video format, is Apex Media's compatible or does it have to be changed/converted in any way?

Any info on the FLH format would be most helpful...

Any URl's on the subject of FLH video format would be a plus!

Also, if you reply to this posting, do e-mail me a copy just in case my news server doesn't pick it up.

Thanks,
phantomm@eastky.net

The ones I know are quite nice and very open minded, I don't think they were too bothered at my local computer club where I was running an Atari emulator on my PC with the trashcan renamed to 'Amiga'. Hmmmm..... The PC users don't much like my hatred of Windoze and my mocking of them using it though.

I'd love too but my machine with CAB 1.5 just doesn't cut it and
everytime I go to magicos.de I get there ISP reporting something in
German.

Please, if the questionaire is not too big, could someone please send
me a copy of the questions or something then put my answers back, as
I'd liked to put my view over. Especially on using the PPC instead.

I'll beat you up for the PC *and* the Amiga! :)

>I have recently aquired an Atari MegaST 2 with 4Meg of RAM and a 20Meg
>Supra Hard Disk.
<<<Snip>>

First you'll need a patch for the bad serial drivers in TOS. Get
HSModem v7 or better. Read the docs with it and put it in the
auto folder on the hard disk. You'll need MFP.PRG and DRIVIN.PRG.

Next you need a internet connection layer. Use STIK 2 as it's easy to
install. Read the docs and edit the script files on a PC to suit your
ISP.

Next you need the software to do something. Use CAB to surf the net
(not recommened on an ST) but news groups and email and FTP can all be
done very well, even better than a PC. Download Newsie and you can do
all that.

If you need any help at all feel free to email for more help, as I'm
not sure how much detail you want.

Here are the questions, please send them to bengy AT mac.com:
Full Name:

Email:

1. Which up-to-date interfaces should the new computer have?
2. Which interfaces do you think are obsolete or not required anymore?
3. Which interfaces do you consider as a "Must"?
4. Which OS would you prefer for the new computer?
5. Which hardware should it be fitted with?
6. How much would you be willing to pay for it at the most?
7. Do you have a suggestion concerning a suitable name?
Additional questions for developers:
8. Which programs/tools/drivers have you developed so far?
9. Which programs/tools/drivers would you be able to develop?
10. Do you prefer developing on your own or together with others?
11. Would you be willing to develop something (agreed upon beforehand)
and keep one of the new computers as payment?
12. If you answer question No. 11 with "No": Which other conditions
would you have in mind?

Yeah...here in the UK I get 5 UKP for a set of four 1Mb SIMM's tested
with TOS 2.06 or 3.06....Old TOS ses go for about the same, or maybe
less....

No John. If Chris created the docs with the commercial FWP he'll need
the same to retain all formatting. ALthough this'll depend on the
quality of the conversion software I suppose.

Are you still waiting for some help, Chris?

I haven't even tried the original drivers, I installed NVDI ET4000
(included in NVDI5) from the start. It works fine with MagiC6, just as
well as a "normal" NVDI.

The formats FLI/FLC/FLH are from Autodesk Animator.

> If PC and MAC does have an FLH video format, is Apex Media's
> compatible or does it have to be changed/converted in any way?

IIRC this is a tricky question. There was some question mark about the
portability of this format with HiSoft's software. I don't know if
this also applies to Apex.

An alternative, though, is to grab Aniplayer v2.13 by Didier Mequignon
from http://aniplay.atari.org - it can read the folowing formats and
has been optimised for the Falcon and TT's with Graphics card displays.

- QuickTime Movies (MOV)
Video For Windows (AVI)
Autodesk Animator (FLI/FLC/FLH)
MPEG 1/2 (MPG)
- Interactive Video QuickTime VR (MOV with mouse control)
- Sounds Audio Visual Research (AVR)
Microsoft RIFF-WAVE (WAV)
Apple Interchange File Format (AIF)
Real Audio (RA 14.4K and 28.8K)
MPEG 1/2 Audio Layer 1,2,3 (MP1/2/3)
- JPEG pictures

More importantly for you it can also _save_ in the following formats:

- AVI, Video For Windows in Microsoft RLE 256 colors (RLE8).
- MOV, QuickTime in:
• Apple Animation RLE 256 colors (RLE8) if screen <= 256 colors.
• Apple Animation RLE 32768 colors (RLE16) if screen > 256 colors.

The unregistered version only has some time delays at program start
and end

It also supports the following standards, so it hooks up really nicely
into CAB and Magic if you pre-load it, so you don't have to waste
online time with the nag screens.

• Long filenames
• Command line & ARGV
• AV-protocol (VA_START, AV_SENDKEY, AV_STARTED, & AV_XWIND)

- Drag & Drop protocol
- DHST-protocol
- ST-Guide (see 'General informations')
- BubbleGEM
- OLGA (see 'OLGA installation')
- GEMScript

It's only $10/5ukp/50FF to register so it's better to support Didier than to have to wait. He EMail'd my key the same day he received my letter.

Hi Mark,
I'm running with a TT and a Crazy Dots 2 and I've just received Magic 6 this week. I think I've set it up ok (well, it works!) so I'm sure I can help.

> I do have drivers but they would appear to be in German and all
> mixed up and in different places on the drive.

What drivers? NVDI4 or 5 or something else?
I'm running with v4.11r3 atm, but I've just got v5.0x and I'll be setting them up over the holidays. EMail me and I'm sure we can get you sorted out.

In return maybe you (or anyone else - I'm not too proud <g>) can help me with a serial port problem I have with the TT and STinG:

I've always been confused because STinG's Serial CPX always starts up showing Modem 1 @19k2 with no flow control etc. While setting up Magic I finally realised that my old Magx.inf was causing this because the lines after #_CTR showed:
#a040000
#b000000

I've changed the first to #a0=0021 and I'm getting close because, even though it still shows Modem 1, when I flick over to Modem 2 in the CPX I get 38400 8N1 RTS/CTS, which is exactly what I want, but I still can't get modem 2 to be selected automatically.

I think the #b line relates to the printer - could the setting be in line #c ? What do I need to change? Currently I'm showing:
#c77700070006000700552005055522207705570750555077031111103

I've got HSModem 7 set up correctly for every other comms program (110 set to represent 38k4) and I've got Modem 2 named in DIAL.SCR and every other terminal I use works fine. I can even run CixComm correctly and follow up by going to the Dialler and there's Modem 1 cropping up yet again.

It's not something I can't work around - I just know there's a fix somewhere.

Waste of time. The SC1224 is a monitor
for games, not serious work, hence the
low resolution and refresh rate (that's
why it needs to interlace to display a
high resolution image).

Do yourself a favour and buy a good
quality SVGA screen if you want
high resolution.

And you have saved the settings in the CPX? and the CPX is active?.
Once saved, the CPX is a boot-init CPX, it'l initialize the port and go
bye bye's.

>While setting up Magic I finally realised that my old Magx.inf was
>causing this because the lines after #_CTR showed:

And mine is..

#_CTR
#a000000
#b001001

Anyway, red herrings dude, the CPX will set all, but if you want you
could load the CPX and set as you require, then save MAGX.INF.

You mention that youve got HSMODEM redirected to use 100, i dont do any
of this twatting and my modem 2 speed max is 115200.

The CPX will set the protocol, and then the dialler selects the port it
needs at the speed the CPX has pre-set.

>
> Well good luck....

Gentlemen,

Do you have any idea what I paid for TOS chips and RAM simm modules
only a few years back?

TOS 2.06 was $59. U.S. dollars excluding shipping.
4 1 mbs were $116.00 or $29.00ea excluding shipping.
(and that was the "sale" price - and the simms were Generic, not Atari)

One does have the option of making an offer.

But if you say that the market value is 5 UKP or $7.5 U.S. for four
simms, ok. well and good.
But at that price, it is hardly worth my time to package them,
and take them down to the post office.
Salvation Army is closer.

BTW - The simms you speak of. Are they Atari or Generic?

Have a nice holiday!

ken

I have the DIAL.SCR set to SERIAL2/LAN, and the SERIAL.CPX set to the
same thing with the baud at 115,400 and when I run the DIALER this is
the port I get and the connect speed, TT30/MagiC 4/10/NIVDI 4/EASE 4

Later, Donner.....

I don't see the point of that. You'd never fill it up! Being an IDE it's not fast enough for D2D recording with Cubase Audio.

I've had a 10.2gig IDE in my Falcon for a year, and I've still got loads of space!

Cheers!

Yeah, it does seem a lttle pointless. I've had a 1.7gb in my STe for
over 5 years now and I only managed to fill some 500mb of it. And
know that I'm moving the drive to a Falcon (partioning it from 8
drives to 1 or 2) then I realised that a lot of that 500mb was useless
old buggy software as I started to backup on to floppys. Things like
STWord, STWriter, DBMaster, 50 odd disk formatters, 20 or so virus
killers. I need to repartition because I need to look forward, so
I'll need a bigish drives to hold CD Disk image.

I think GIFBAT which came on a cover disk to AC? I remeber something
about it in AC, and IIRC it is a TTP that strings a load of GIFs
together to make an animation. I've deleted it off my HD so I can't
tell, but I could search through my cover disks if you like.

>I guess I will never use it as a photo-CD player, as Apple
>cannot provide me with the adapter cable, and there are
>no schematics to figure out the connector pinout. Oh, well.
I you can't find spare parts for the Apple PowerCD go and check out a
Philips service center.... the Apple PowerCD and Philips CDF100 are
identical except for the SCSI interface which is lacking on the Philips.

>Since so few people have seen this, I'll describe it: It is
>a squarish package with the circular door/CD holder that
>hinges out. The door has a back-lit LCD display for track,
>time, etc. The main unit plugs into the power adapter/SCSI
>circuit base such that it is inclined at about a 45 degree
>angle. Very cool. Very Apple-ish.
Yes it looks great... but Philips designed it ;-), the only difference
between the two is the Apple logo, two Mac HFS disks with drivers for
Mac OS 7.x and the SCSI interface.
I haven't followed this thread... if the infrared red remote control is
broken or missing, you can use a Philips replacement which costs 25 Euro,
the PowerCD can be attached to a TV by means of a simple RF adapter cable
(the same thing that connects an ST to a TV). You have to set the TV to
channel 36 to get a picture.
Rechargeble batteries are still widely available for it, these are the same
type as the ones used in the older Philips VCR cameras...

Cheers from Belgium

Source record: 52887

From: Michael and Nicole Freeman <nameerf@flash.net>
Date: Thu, 14 Dec 2000 01:22:38 GMT

Hi Michael,

>1. PPC 603e CPU (up to 200MHz), which runs 680x0 software at about the
>same speed as up to a 100MHz 68060 (the "up to" means it will run at that
>speed with Nemesis or similar bus accelerator).
>2. 2 SDRAM slots for up to 256Mb of fast RAM
>3. dual processing with either the 68030 or other CPU replacement cards,
>such as Afterburner (and maybe CT60?).
>4. Plug-n-play operation, with the option of soldering in a single wire
>foradded Falcon compatibility.
>5. Priced at about $300 US / 300 Euro / 199 UK Pounds.
Well the specs are nice, but aren't they always ?
300 Euro for a card which in practice will only be usable as a memory upgrade
seems a bit steep to me. As long as there isn't any software that is written
specificly to run on the PPC processor, it's useless.. they could just as
well have sticked a Pentium or Athlon on top of it.
Considering that the Hades and Milan are around for quiet some time now and
that for those computers no one bothered to write specific software, I think
finding programmers developing applications for the Tempest are minimal.

>This card should be faster, cheaper, and allow for better compatibility than
>the CT60 (from my own comparison of the specs), and allow people to make PPC
>ports of software, which will run even faster than the specs I quoted in #1!
>I'm quite impressed, personally, and look forward to this card.
No way... Mac PPC's with a 603/200Mhz can barely emulate an 68040. It's only
faster when the PPC is actually used, since there isn't any software you'll
have to run the card in the other mode => 68030. Who on earth do you expect
to be porting that software? and what software? Firms like ASH, Invers or ROM
didn't even bother about the Hades and Milan.
Even the shareware and PD market ignored these computers, I'm sorry Mike but
I'm not even slightly impressed with the specs, it sounds to me that the PPC
argument is nothing more then a useless and costly gimmick...

>This card does seem to be a reality, despite what the nay-sayers
>have said, and isn't a Cortex vaporware rumor. I hope people will support
>this card, too! Both are equally viable accelerators that seem to be pretty
>high-powered stuff!
OK. Lets assume that it really exists and isn't vapourware, the problem is
that it isn't an accellerator at all! it accelerates absolutely nothing. If
you're in need of 256Mb RAM then it might be a valuable option....

>which has caused the hoped for addition of a USB port to not become a
>reality (which may be why they were taking longer than expected to produce

>the card?). However, this may be an additional add-on they'll make in the
>future.
And will be an additional useless feature... USB ports are fine, but without someone writing suitable drivers of no use at all. Manufacturers don't just "give" their specifications away, they want hard cash in return.
On a platform as small as ours, these drivers would cost probably more then the Tempest card.

Instead of waiting for cards that might never appear or in the case of the Tempest will never even accelerate anything, just sell your Falcon and add the money you're prepared to pay for the Tempest card... this should be enough to order a Milan, which will be delivered by UPS next week at your doorstep and enjoy computing like you never did before...

Is this a ridiculous suggestion? just think about it.. you can stick as much cheap RAM in the Milan as you like, it comes with a graphic card , nice fat speedy harddisk, CD-R... etc.
If you want to add an Ethernet-, SCSI, MIDI, DSP or even TV card no problem, its all available *now* :-)

Cheers from Belgium
Dennis

Hi Bengy,

>Exactly, I told Ulrich (The Medusa "spokesman", who is organizing the whole
>fiasco) the very same thing. Even at this point, the public has heard no
>direct statement from Medusa. (I agree - kinda strange)
It seems to me that a firm that is producing Atari clones for well over five
years now, should at least have a pretty good idea of how the market is like.
If *they* don't have a clue, I wonder who does....

I suppose that you've somehow must have checked mister Ulrich Goessel his
credentials? My first thoughts were that he's some German version of Jared
Falvo... just try imagine the outcome if we could lock these two up for a
couple of hours in a small room.... :-)

Cheers from Belgium

Date: 20 Dec 2000 18:31:26 +0100

Hi Michael,

>The 500 minimum buyers they want is more than the total number of Milans
>sold so far. And these *are* still being sold *now*.
Unless Milan gets his act together these numbers probably will not rise significantly... Milan makes me think of Atari, great at R&D but lousy at marketing. One would think that the Atari debacle would have served as an example how *not* to conduct business, but Milan goes to show that lessons must be learned the hard way. Announcing the Milan2 while the Milan1 was barely available was a colossal mistake in the first place. Potential buyers were likely to wait for the successor..., every kid following an an econmy-class knows this... one doesn't *kill* the chicken that produces golden eggs, unfortunately Ali G. and company didn't seem to know this.
I'm convinced that Milan could easily double the numbers of sold units in a couple of months, if only they would change their market "strategy".

In Germany which is the Milan *home-market* after all, it's quiet difficult to get hold of a Milan, only a handfull of dealers sell them. Supporting the local dealers sounds very nice on paper, in practice it must be clear by now that it doesn't work... why on earth can't the public buy the Milan straight from the manufacturer? it should have been possible from day one to order a Milan and it's peripheals online from the Milan website and UPS delivering the goods within a week.

Which brings us to Atari users located elsewhere.... if you follow CSAST regularly surely you must have noticed the postings of people wanting to know where they possibly could obtain a Milan? except for France, Holland and England where a handfull of dealers are supposed to sell them at prices that are a lot higher then the German retail price, it's easier to spot an UFO then to obtain a Milan.

AFAIK the Milan can be bought in an assembled computer version or in a DIY kit package. Getting hold of that DIY kit is virtually impossible, there isn't one dealer in Germany able or willing to sell this.... why? That kit is considerably cheaper and many people have got spare HD's, CD-R's, RAM or can get them cheaper from a third party, that kit is 600DM cheaper opposed to the assembled version, 600DM could make *all* the difference...

Selling a computer with *only* German docs, OS and programs, IMHO is equal to committing suicide if one wants to capture a piece of the market. German is a nice language, but I strongly doubt that an American will be charmed by it. AXRO at least knew this, and contacted several translators including DDP to produce local translations for the Milan2...

Since polls are popular lately, let's have one here as well :-)
Supposing.....that Milan would change his marketing strategy radically and offer various packages of the Milan by direct marketing online from their website and ship these anywhere in the world like a:

- Milan040 DIY kit basic version for 1000DM/300 ukp/$450
- Milan040 DIY kit with MagiCMilan for 1100DM/330 ukp/$485
- Milan040 DIY kit with the 060 upgrade 1600DM/470 ukp/$695
- etc....

The kits would be available with German, English or French docs, OS and programs.. it would also be a very good thing if Milan puts this poll on their own website, and for a change actually communicate with the Atari community.

The costs for this operation would be minimal for Milan since the packages already exist, it's merely a matter of replacing the language CD.... since most of the programs included are already translated in English and French all that needs to be done is to translate the manual(s)... I reckon that in less then two months, Milan could be in business...

So let's hear it guys... who's interested in a DIY kit at the above quoted price? the kit contains all necessary cables, screws, processor, TOS, suitable drivers and graphic card. All that needs to be done is to plonk the whole lot in an ATX tower, add a HD, CD-R, Floppy and some RAM....

Unrealistic? dreaming ? who knows? but isn't it worth just trying? At least it's better then waiting for some vapourware with unknown specifications to appear. The big advantage over the Tempest and Medusa projects is that we know for sure that the existing software base will actually run on it. While the CT-60 is a a more viable contender all it does it speed up the Falcon, but then there's still the problem of by today standards crappy and very slow graphics not to mention the lack of a fast 10Mbit/sec network option, and ST, STE, Mega, MegaSTe and TT users are left in the dark...

Cheers from Belgium

I went to the site, and left most of the poll blank. I did this because I didn't care about most of the questions, but I understand why they would ask them.

What I did do was write a long comments sections. In brief, what I said was that to be successful, they would have to provide value for the money, and software that was able to handle file formats from the more popular PC programs. That way they have a chance at increasing the size of the market. If they are just trying to sell to the existing Atari market, it's eventually doomed to failure since the market continues to shrink.

You can't stay in business selling to a shrinking marketplace. Plain economics.

Hi Lyndon,
Sounds like a neat program but it does'nt sound like what I'm
looking for so don't go crazy trying to find it! (although I would'nt
mind having it). I can cut a section out of a GIF 'still' (with True
Image) and paste another GIF 'still' in it's place after I've converted
a JPEG to a GIF using Image Copy but that's where it ends since I want
to replace the cut out portion with an animated GIF. Thanks though,
John G.

This is said as if Dennis read my mind! I find it downright strange that
the only company (read Medusa) that have successfully made two TOS clones
are planning such a thing, and now ONE notice on their pages. I also have
big problems believing that Fredi would use a ColdFire for any "next" TOS
clone. I think Dennis is closer to the truth than he thinks ... perhaps
;-)

I think the best way to do it is to rip apart the animated GIF and
paste each frame into that "still" GIF and recompile the whole lot as
to speak to an animated GIF. If you understand what I'm saying.

The "still" GIF in each frame will stay the same, even though it's
being animated because, on each frame that section is identical to
that section on all the other frames.

The program is actually called EasyBat, and I've skimmed through the
review but I don't think it's the sort of program you're looking for.
The address is http://www.perso.wanadoo.fr/gtello/ the link is 2
years old, but if that is a broken link email me and I can send you it.

Hi all,

I have just (in the eleventh hour!) added a nice set with 44 christmas
icons from Hideki Itoh in the artist section. (Gallery 11)

In ordinary archive you will find these additions:

Archive 83, 22+22 Chrome icons by Digital Garage (both 32x32 and 48x48)

Archive 84, 22 flag icons

...all converted by yours truly ;))

Merry Christmas!

/Joakim

Source record: 52805

Ken,

But that was a few years back. Memory prices move on almost a daily basis,
not monthly or yearly.
256K simm modules are probably worthless unless you have a PC that will only
work with 256K and
are desperate for some SIMMS for it. I have about 20 or so 1 Meg ones in a
bag in my loft (attic or whatever) and
as you say its not worth going to the post office with them to send them
off. (If desperate ask in the group)

In fact I recently junked some 386 servers, not because they did not work,
but because I needed the space and no one wanted
large boxes with little CPU power.

Also whilst there might be ATARI branded SIMMS they were probably selected
for being slow rather than being
"better". I think (and its some time since I upgraded) STE's will tolerate
80ns SIMMS, whereas most PCs need
70 or even 60 to run with no wait states. So ATARI probably bought the
rejects that did not make the speed and
stuck ATARI labels on them.....

Dave.

Is anyone running this OK on a CT2?
The demo version doesn't seem happy here.

Of course I will! :-) Horses for courses.

> Being an IDE it's
> not fast enough for D2D recording with Cubase Audio.

Not quite true - Cubase Audio was written
to *only* work with SCSI because at the
time, AV SCSI drives were the only
type capable of sustained transfer. In any
case modern EIDE drives can wipe the
floor with anything you can put on the
Falcon's slow 8-bit SCSI bus, and
I've got a CT2 which improves IDE
transfers further. This 75 GB IBM drive
was the fastest EIDE drive on the market
(100 MB/s busrt, 37 MB/s sustained)
until recently overtaken by its new
brother in the Deskstar 60GXP range
(40 MB/s sustained). Any music that's
taking 40 MB/s bandwidth has something
very wrong with it! (Not that you'd get
that on the Falcon IDE, but in principle...
and I've built countless PCs for multi-track
digital audio using EIDE very well).

SoundPool software all works best on
IDE, and is officially recommended.
I use both Audio Tracker and V-Trax
on IDE and they work superbly.

> I've had a 10.2gig IDE in my Falcon for a year, and I've still got loads
> of space!

We must be doing very different things
as my 10.1 GB secondary IDE was
full two years ago :-)

>An alternative, though, is to grab Aniplayer v2.13 by Didier Mequignon
>

Thanks for the Info.

I am a registered user of AniPlayer and do convert my FLH videos made
with Expose into MOV and etc.

I don't have a MAC at the moment, but recently someone told me that
MOV's made from FLH files with AniPlayer are not compatible with MAC!
Not sure if thats correct or not.

Anyone know if Apex FLC and FLH videos converted with ANIPLAYER into
AVI and MOV are compatible on PCs and MACs??

Also is FLC or FLH a fairly common format for PCs or MACs today?

In other words, do alot of the good Graphics and Video players include
support for FLC and FLH?

Any other info on FLC and FLH formats is much appreciated.

Hi,

Does anyone have a copy of ST Format July 1992 (with or without coverdisk)?

Or does anyone have a copy of The Financer v1.1s which was included in this issue?

Thanks

The problem is that things never stay still. What was expensive then
is worth nothing now. The chips haven't changed but the world has.
And what applies to chips also applies to complete (functional)
machines.

It won't be lack of interest that kills it, it will most likely be that
ColdFire idea that kills it. I filled out the questionaire, didn't
care about the options, but like some others I expressed my opinion
to move to PPC in the comment section. I sprung for a Hades060
and I am willing to move on, but not a ColdFire design.
At this point I'd much rather try the DesTTiny with the PCI
adapter with my Hades. ;-)

If you keep it locked up at home then of course
it won't. You need to hang it on your trousers,
slap on some Brut 060 and strut down to the
local clubs, pubs and beaches.

7438. MidiTree: Merry Christmas from Tim

Newsgroup: comp.sys.atari.st
Date: 2000-12-24 05:17:27 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <9240t5$a6v$1@nnrp1.deja.com>
Source record: 52821

Just uploaded a file to the File section of Atari-Midi. Look for "Midi Tree", a Christmas program...St Low res. It is a midi file player that plays 128 different christmas songs one after the other. The lights on the tree light up to what the music is doing. Pretty cool.So thats my Christmas present to all of you.

So Merry Christmas to all Atarians!!!

Hi Harry,

HS>If Chris created the docs with the commercial FWP he'll need the same
HS>to retain all formatting.
yes. But what about 1WP2LTX (1st Word Plus to LaTeX)? Okay, that
demands for a LaTeX system (exists on nearly all platforms).

We're told that a MiNTnet setup can access secure sites.

I couldn't comment any further because I haven't tried it - but it does
seem to contradict your sweeping statement! :-)

A long shot - do you use Zcontrol? If so, that has problems saving
changes back to CPXs.

Hi Tim...

Thanks for the info; I'll check out the utility. A friend of mine near Chicago has a 1224 monitor sitting in storage that he may be able to find once the thaw comes. I'll see if that will do before I burden you with trying to convert the many random files I hsve on these disks. Thanks for the offer.

I also have my old TT set up at my mother's house, but I remember there being a problem getting SMPTETRACK to run on it... prolly worth another try though...

Dennis

> try though...

AHHH...now you are saved. On my site is the final version of Editrack
ver 7.0 as well as the beta versions of SMPTE Track . All of those work
fine on a Falcon and a TT030.So just download those, put them on a 720K
Dos formatted disc...or with a TT...you don't need to...just a "regular
1.4M disc. and you can convert your files from there. Let me know if
you have any q's on the new style of Editrack. It's a bit different,
has more funtions...and might even convince you to find another Atari
to run just that!

The program is on my HYBRIDS ARTS page or the DOWNLOADS Page.

have a great Christmas

7454. CAB.OVL 1.410 release

Newsgroup: comp.sys.atari.st
Date: 2000-12-24 19:41:22 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a465162$1_2@athena.netset.com>
Source record: 52828

Well I think I got it working well enough to do a general release.
There might be a few problems running around still, so keep a back up of
your current OVL.

http://www.netset.com/~baldrick/

Changes:

Numerous small changes patches and fixes.
HTTP 1.1 compliance in place.
User can now configure OVL to not display the infamous
POST/GET/CANCEL dialog.

Have a happy holiday and I hope you enjoy this small gift
from me.

Harry, I'm no expert, but with my TT I use Serial2
and I have in Magx.inf:
a#a0<0021
b#001100

Hoping you get this sorted,
Merry Christmas,
Charles.

I'd love to have a memory upgrade that runs software as fast as a 100MHz
060! ;)

> finding programmers developing applications for the Tempest are minimal.

The way it's supposed to work is, when you run programs on it, it interprets
the programs as much as possible into PPC code and saves a separate program
file that runs directly on the PPC. What can't be interpreted runs through
an emulator, which they say is quite fast compared to older emulation
methods. Their estimates are that it will run as fast as what I quoted. Now
whether you believe that or not is up to you.

> No way... Mac PPC's with a 603/200Mhz can barely emulate an 68040. It's only
> faster when the PPC is actually used, since there isn't any software you'll
> have to run the card in the other mode => 68030.

I'm only going on the specs presented by Istari, Cortex, and others. And
like I said, it is supposed to do a bit of decompiling and re-coding of the
software. They say it's possible that some programs will run faster each
time they're run, as sections of the program get progressively translated.

> Who on earth do you expect
> to be porting that software? and what software? Firms like ASH, Invers or ROM
> didn't even bother about the Hades and Milan.
> Even the shareware and PD market ignored these computers, I'm sorry Mike but

> I'm not even slightly impressed with the specs, it sounds to me that the PPC
> argument is nothing more then a useless and costly gimmick...

Well, if it is indeed faster than the 68060 options available currently (as they say it will be), I'm *VERY* impressed. But, as you say, it could just be a gimmick, so we'll wait and see if they release any benchmark tests and such and see what it looks like.

As far as I'm concerned, the 680x0 line is a dead end, and as soon as they completely quit making them, we'll have no choice but to move to a PPC or other type of chip. So why not start now, while we at least have the option? And as 680x0's get more scarce, we'll have no choice but to re-compile the software to run on PPC's or other CPU's, or come up with better emulation schemes, as these people have claimed to be doing. My personal opinion is that the only real progress we can make at this point for the future, is to move to another CPU type that is actively supported and available, otherwise we'll just gradually get our supply of CPU's cut off completely.

> cases as we all know!).

Supposedly, the software runs through some sort of translation program,
which interprets as much of it as possible into PPC code, and saves it as a
separate program file. They say it's possible that more code will get
interpreted each time you run it, making it run faster each time. Aside from
that, they say that there are other new techniques used in their version of
68030 emulation that makes it quite fast and compatible.

> 2) Software compatibility again... I'll be using the MIDI sequencer

> incompatible, but you never know...

This may be a problem, as the emulation is supposed to emulate a 68030, and
who knows how Notator would react in PPC code. They do offer
dual-processing, however, meaning that if it doesn't work, you can still
revert to the original CPU to run it.

7462. Tempest

Newsgroup: comp.sys.atari.st
Date: 2000-12-24 22:49:28 UTC
From: Artur Stachon <astachon@intergate.bc.ca>
Message-ID: <3A467D78.2413BBC7@intergate.bc.ca>
Source record: 52778

If this is true what you guy say that Tempest doesn't accelerate then why bother to make an accelerator like this ? Would it make any sense to make pentium 4 CPU and no previous software be able to run on it ? And why would you want to have 200Mb Ram on Falcon anyway ? It would never use even 1/10 th of it.

"Additionally, the emulation is fully compatible to an MC68030 while a real MC68060 is
not. Accelerators using an MC68060 suffer from more incompatibilities than Tempest does. The highly intelligent emulation software does not emulate an MC68030 instruction by instruction. It translates the currently existing MC680x0 code into PPC-native code all at once, stores this file on disk and then executes it"

I think Tempest is nothing else than Atari Falcon hadware Emulator based on Macintosh PPC cpu.

"200 MHz Tempest equals a 100 MHz 68060 "

Why then not use cheaper motorola 68060 Cpu instead ?

" Emulating an 680x0 processor

The Atari software that exists today requires an MC680x0 CPU, which Tempest
needs to emulate. Luckily, the Emulation is one of the strong points of Tempest - it
currently emulates a full MC68EC030 CPU incl. caches most of the MC68882 FPU instructions all integer-related MC68060 instructions In the near future, the Emulation will be upgraded to also handle

MC68030 PMMU-instructions
all MC68882 FPU instructions
all MC68060 instructions

Additionally, the emulation is fully compatible to an MC68030 while a real MC68060 is
not. Accelerators using an MC68060 suffer from more incompatibilities than Tempest does.

The highly intelligent emulation software does not emulate an MC68030 instruction by instruction. It translates the currently existing MC680x0 code into PPC-native code all at once, stores this file on disk and then executes it. Critical code-segments that cannot be prepared in advance are dealt with at runtime - but then stored on disk, too, so
applications may speed up every time you run them. In fact, the emulation can even handle self-modifying code to a certain degree, which

usually gives a lot of trouble on the MC68040. "

A program I just installed on my Atari ST's hard drive has caused the drive to freeze on boot up. If this were a PC, I'd just boot off a boot disk, delete the offending program, and all would be OK. But as near as I can tell, there's no equivalent on the ST. Am I wrong? How can I gain access to my hard drive to delete the program that's leeping the drive from booting? Thanks for any relevant advice.

> drives to 1 or 2)

There's got to be a reason for you
getting a Falcon, and it's probably in
order to do things you couldn't do on
the STE. Rest assured, once you start
using your Falcon to its potential, that
1.7 GB will disappear very quickly!

> then I realised that a lot of that 500mb was useless
> old buggy software as I started to backup on to floppys. Things like
> STWord, STWriter, DBMaster, 50 odd disk formatters, 20 or so virus

I'm sure you're not getting a Falcon to use
as a glorified disk formatter!

> killers. I need to repartition because I need to look forward, so
> I'll need a bigish drives to hold CD Disk image.

With a Falcon you don't need that.
Burn straight to CD at 4x speed.

What are you using to boot the drive? If it is an ICD driver, then there is
a program called icdboot.prg. If you are using HDDriver, then there is a
program called hddriver.prg. Just boot the computer and run one of these
program from a floppy. Then just installed the partition icons and you
should have access.

Thanks Tim... I just visited your page and d/l'ed the Editrack files. Since it is freeware and dongle-free, can I assume that I can use Gemulator to run it on my PC? I just queried Darek Mihocka tonight, and he told me that Gemulator doesn't work with any dongles or copy protected software, but perhaps it will with Editrack? I haven't kept up with the emulation scene for a while so I'm not sure if there is midi support with Gemulator, but since I'm only looking to open my old SNG files and resave them as Midi 1 files, perhaps this might work. The only reason I don't go straight to the TT is that when I turned it on tonight, I found my mouse to be acting wierdly... only scrolls in one direction (after cleaning) making it pretty rough to maneuver... and I'm too cheap to spend the $35 on a replacement mouse... unless I absolutely have to...;-)

BTW it's nice to know that there is still the some of the old Atari community floating around out here. Reminds me of my old GENIE days... the Atari people were always the first there with the answers. Thanks again...

Hi everyone...

Does anyone have any experience running Gemulator 2000 with MagicPC6.0? I found the German demo, but I'm a bit queasy on installing it if I don't know what I'm doing. I remember running earlier versions of Magic and Gemulator on an older PC a few years back without too many problems, but it's been a while, so I thought I'd ask around here before I do something silly. Thanks....

Dennis

> SNG files and resave them as Midi 1 files, perhaps this might work.

YES...That should work. Gemulator I heard has limited midi support, but
as long as you don't PLAY the file and just do the conversion...file
management stuff...i see no reason why it should not work. Had a report
that you can use the PVG in DR T's KSC to process midi files as long as
you don't hit the PLAY button...then gemulator crashes.

there is another emulator that DOES work on Midi and that is
STEem...although the bugs are being worked on as we "speak".

The
> only reason I don't go straight to the TT is that when I turned it on
> tonight, I found my mouse to be acting wierdly... only scrolls in one
> direction (after cleaning) making it pretty rough to maneuver... and
> I'm too cheap to spend the $35 on a replacement mouse... unless I
> absolutely have to...;-)

You can download GENMOUSE from the Atari-Midi file section and that
will work with any regular serial mouse on the Modem or serial port on
the TT. You can also use the keyboard to minipulate the mouse : Hit
ALT and use the Arrow keys to move the mouse I beleive.INSERT is Right
Click.

>
> BTW it's nice to know that there is still the some of the old Atari
> community floating around out here. Reminds me of my old GENIE days...
> the Atari people were always the first there with the answers. Thanks
> again...

You will find the Atari Community is still very Strong, especially
since all this great Software is being released. A good time to get
back into Atari for a more stable platform for Midi work.

Hi Shiuming

>Rest assured, once you start
>using your Falcon to its potential, that
>1.7 GB will disappear very quickly!

I suppose, but it'll not be the programmes taking that space up. I'll probably find myself cluttering a bit samples folder up with massive 16bit 44khz samples. I know, I had about 100mb of samples and they were only about 15khz rubbish. I'll go mad when I hear decent sound coming out of my Atari for once.

And I'll probably be sitting down and watching all the MOV files on the Lego Mindstorms CD. Just doesn't look good in monochrome and 1.2 frames a sec. And I'll be able to play MP3....

Hi Jim,

JP>How can I gain access to my hard drive to delete the program that's
JP>leeping the drive from booting?
any modern driver allows you to type in a (from C) different letter,
e.g. D or even A, just after the driver's message has been displayed
on your screen.

Afterwards you delete the program in your AUTO folder, ACC or whatever
did upset you.

Second solution: Power on the hard drive _after_ you arrived on
the desktop and run the driver from a floppy. Most of the drivers
named *.SYS may be renamed to *.PRG and be double-clicked!

Und TTschï¿½

Hi!

I would like to ask someone who knows anthing about harlekin III. I have this program because harlekin II has problem with date beyoun 1999. My problem with new halekin is macro option in it. In previous version II i had txt macros and hpg macros ect., but in this new version ther are not such macros. In new harlekin III everything is the same, only macro mudule is not the same no more. So if anyone knows anything, how I can contakt someone through mail or the man who wrote this program, please mail me private.
Thanks to all who can help!!

yours sincerely,
Trampa Radovan

Source record: 52718

From: Michael and Nicole Freeman <nameerf@flash.net>
Date: Sun, 24 Dec 2000 22:09:26 GMT

Hi Michael,

>I'd love to have a memory upgrade that runs software as fast as a 100MHz
>060! ;)
So would I, I can only guess how fast a 68060/100Mhz *would* be, since it doesn't exist, but I do know that a 603/200Mhz running in native PPC mode will not even come close, under emulation it will barely be faster if not slower than a Milan or Hades040.

>The way it's supposed to work is, when you run programs on it, it interprets
>the programs as much as possible into PPC code and saves a separate program
>file that runs directly on the PPC. What can't be interpreted runs through
>an emulator, which they say is quite fast compared to older emulation
>methods. Their estimates are that it will run as fast as what I quoted. Now
>whether you believe that or not is up to you.
Indeed... and I don't believe a single word of it.

>it is supposed to do a bit of decompiling and re-coding of the
>software. They say it's possible that some programs will run faster each
>time they're run, as sections of the program get progressively translated.
???
I would love to know what programs will run faster each time they're run, you do realise that this is messing with the law of physics? If they can pull it off there's a Nobelprice waiting for them...

<serious mode off>
Come to think of it.... they're gonna get two Nobelprices!! just imagine... These guys are claiming they've found a way to speed up a processor merely by writing some "super-code" for it, well IBM and Motorola will be very interested, can you imagine what this will do for a G4?
Intel, AMD and MS probably are shaking in their boots right now.
<serious mode on>

Michael, suppose someone would claim that thanks to some nifty programming it's now possible to achieve the speed/power of a TT on a simple ST, what would you think of such a statement? Well, that's exactly what Titan is claiming....

>Well, if it is indeed faster than the 68060 options available currently (as
>they say it will be), I'm *VERY* impressed. But, as you say, it could just
>be a gimmick, so we'll wait and see if they release any benchmark tests and
>such and see what it looks like.
I'm not the expert... they're people here which have a much bigger knowledge

on the topic, I'm just using some common sense. A 603/200Mhz *can't* possibly be any faster then a 68060, not in pure speed and power anyway. It might be faster at doing floating point calculations but that's beside the point.

>As far as I'm concerned, the 680x0 line is a dead end, and as soon as they
>completely quit making them, we'll have no choice but to move to a PPC or
>other type of chip.
Why did you buy a Falcon? when it was released the 68030/16Mhz was a dead end as well.... it doesn't mean because the development on 680x0 line has come to an end that it's not a viable option anymore. Even if the production would be stopped tomorrow, there are enough 68060's around to last us a lifetime. It's not like millions of people need one...
Talking about dead ends... that PPC603 has had it's best time as well, if you ask me.

>So why not start now, while we at least have the option? And as 680x0's get
>more scarce, we'll have no choice but to re-compile the software to run on
>PPC's or other CPU's.
Ever heard of MagiCMac? following your logic one could just as well buy a Mac PowerPC and as an additional bonus will be able to run Mac software also. And yes I know that recompiling is not the same as emulation ;-)
Just ask yourself the question who's going to recompile what... even if some programmers were willing to rewrite their programs, they'll need the proper tools, who's going to write the programming software? compilers, debuggers, editors etc...

>My personal opinion is that the only real progress we can make at this point
>for the future,is to move to another CPU type that is actively supported and
>available, otherwise we'll just gradually get our supply of CPU's cut off
>completely.
Without Atari software written/ported to run in native PPC code, there's no real advantage in this for the user. Production of the 68000 has stopped ages ago, but they're still in supply, same thing for the 6502 which drives the Atari 800/XL/XE, it wont be any different for the 68060.
What you're proposing is to drop compatibility in favour of raw power. I can see your point, but considering that a clone with a real 68060 will run even faster then the 603/200 while retaining software compatibility, I think it's better and cheaper to opt for a Milan or Hades instead of adding a card into an old computer that by today standards had has its best times anyway...

IMO Milan and Medusa are the only two firms with enough knowledge and experience to produce " a next generation clone", but without support it will never happen. In my book support means bying their products, these two firms deserve a Nobel price as well... one for courage and perseverance, why they haven't closed the books and tossed it all in is beyond me... all they've received over the years is negative criticism... how many unhappy Hades or Milan users do you know?

Cheers from Belgium
Dennis

7499. Re: XTOS Poll

Newsgroup: comp.sys.atari.st
Date: 2000-12-25 15:45:38 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <977766062-22967AEicMi@gmx.net>
Source record: 52719

From: Lonny Pursell <fatal@SYNTAX.ERROR>
Date: Sat, 23 Dec 2000 22:46:15 +0000

Hi Lonny,

>>I also have big problems believing that Fredi would use a ColdFire for any
>>"next" TOS clone. I think Dennis is closer to the truth than he thinks ...
>
>It won't be lack of interest that kills it, it will most likely be that
>ColdFire idea that kills it. I filled out the questionaire, didn't
>care about the options, but like some others I expressed my opinion
>to move to PPC in the comment section.
There will always be interest when someone announces a new "TOS clone"...

If we would announce tomorrow that we've been working very hard the past year designing the next "generation", and annouce some details like that it will run on a Sun UltraSparc/666Mhz, comes with Firewire, USB, PCI, AGP etc.. and last but not least is completely TOS compatible thanks to some clever coding on your part... let put a picture of a motherboard showing nothing at all really on the website, ask anyone who's interested to fill in a questionaire asking stupid questions like how much they are prepared to pay for it, or if it should have a VME interface...
Next step is to inform the leading Atari websites like MagiC Online, ATOS, Place2be, MyAtari, Atari-world... etc of our little venture. Don't forget to add that we've lined up a truckload of developers who are all eager writing drivers and new powerfull software for it.
To make the project even more appealing we'll announce the inclusion of a softwarebundle, containing software most of us already bought years ago, but then who cares anyway... To drive everyone wild we could even publish some benchmarks that are to good to be true and add that these can only improve since they're taken from an early development board...
Who's gonna manufacture the boards? since Milan teamed up supposedly with Motorola I suggest we announce that IBM will take care of it, marketing wise this sounds better then an OEM firm...
In a couple of months when the interest falls back somewhat, we'll announce that the machine is coming along nicely and that we've managed to squeeze an Internet Explorer 5.5 clone in ROM... that should be enough to keep interest going untill next Xmass.

Let me tell you Lonny, there will be enough people interested.... and the few ones that are sceptical will not be heard. People like to finally read/hear some positive news for a change and the timing is just perfect for it.
Any clown can announce anything, checking the story is virtually impossible and in the mean time the biggest majority stick to their Falcons and TT's waiting for better things to come.... :-(

>At this point I'd much rather try the DesTTiny with the PCI
>adapter with my Hades. ;-)
To do what ?

Cheers from Belgium
Dennis

Hold down the Alt key while booting, run your hard driver from a
floppy, put an icon for drive C on the desktop and open it.

Hi Don,
Can you UUE Email me the DRVIN, MFP_TT and SCC files you're using?
I've never got around to doing this properly and it's the only thing
that'll get me to upgrade my modem all the way to 57k6 from my current
33k6 jobby. Thanks!

A million times. Believe me... B^<

> Once saved, the CPX is a boot-init CPX, it'll initialize the port
> and go bye bye's.

It does, but to modem 1 19k2. I can't explain it...

>> While setting up Magic I finally realised that my old Magx.inf was
>> causing this because the lines after #_CTR showed:
>

>Anyway, red herrings dude, the CPX will set all, but if you want you
>could load the CPX and set as you require, then save MAGX.INF.

I have to run the CPX everytime and it just refuses to save to
Magx.inf. I've had to make the amendments manually and then they don't
get overwritten either...

> You mention that youve got HSMODEM redirected to use 100, I dont do
> any of this twatting and my modem 2 speed max is 115200.

That's what I want, but I just can't make it happen. Of course, on the
TT the modem 2 port is a bit screwy and above 38k4 only supports the
non-standard 76k8, 153k6 and 220k4 %^X

> The CPX will set the protocol, and then the dialler selects the port it
> needs at the speed the CPX has pre-set.

It could be that having set the 110 speed, the switching of the port
in DIAL.SCR is sufficient to sort me out. It may be working ok, but I
don't want to go online at 110 on modem 1 to find out!

I'd doubt if there were any Atari branded SIMMs. Just being SIMMs was
enough - that's would be why they standardised on them.

Plus, I remember Paul Rossiter writing that an STe would not gain any
advantage from 256Kb SIMMs faster than 150ns or 1Mb SIMMs faster than
120ns.

Works fine here converting FL? into AVI, MOV and QT files from Falcon to
Mac (G3) in Quicktime. Quicktime files from the Mac don't seem to work
properly in Aniplay though.

> Also is FLC or FLH a fairly common format for PCs or MACs today?

Nope.

> support for FLC and FLH?
> Any other info on FLC and FLH formats is much appreciated.

Graphic Converter on the Mac will load and convert FLC files to animated GIFs.

Hope this helps

Chris

Sounds to me like you need Papillon.... available from ASH. You can
download the demo version 3.0 from their website. Only available in
German I'm afraid since the programmer doesn't want to coorporate
producing a proper English version :-(

Despite this, it's probably exactly what you're looking for and comes
with some nice additional features thrown in....

Hi Shiuming,

>> I'll need a bigish drives to hold CD Disk image.
>
>With a Falcon you don't need that. Burn straight to CD at 4x speed.
Burning Audio CD's or large files yes.... but then try burning a CD
containing for example 10,000 small fonts or thumbnails.. You'll get
a buffer underrun before you even know it. The type of writer used is
also important, if it comes with a big RAM buffer then it *might*
just be possible, but I would feel much safer with an image file...
Having a 1Gig partition especially for the CD isn't such a bad idea
after all, unless he'll use CD Recorder Pro, he'll have a hell of a
job creating certain CD's...

Cheers from Belgium

Interesting one this, the relevant instructions for ICD are in the readme on the program disc, for HDDriver, on page 7 of the manual, you do have the origional disc or manual.....?

Over christmas, I transfered over 26MB of stuff off my Falcon to my PC so that I can backup them on a CDR. It took over, 2 hours over a RS232 link, at 115Kbps & 8N1 settings. I was using Zmodem, and the rate was 3200CPS.

Why shouldn't it be 115200/9 = 12800CPS??
It seems to be 4x slower.

Hi Harry,

I have my Dial.Scr file set to SERIAL2/LAN, and STING SERIAL CPX to
SERIAL2/LAN and the Baud at 115,400, I've made no changes in MagiC..

When I run DIALER I connect at 115,400, now if you will go up to
CONTROL and open The STING SERIAL CPX and try to access SERIAL2/LAN you
will get a message that the port is in use and cannot be configured.
This seem to work for me ??

Check Your E-Mail

Later, Donner......

7523. Atari ST Newbie

Greetings to all!

I just purchased an Atari 1040STe. Back in the days (mid to late 80s) I owned an Atari 800XL and loved it more than any other PC since. So I am interested in getting back into the Atari scene but am looking for any help I can get. Need help with the following?

What kind of monitor do I need for my Atari ST? Is a TV ok?
How can I tell how much RAM I have?
What is the latest version of TOS I can run on my 1040STe?
What upgrades can I purchase for my STe?
What is the max video resolution I can achieve?
Can I hook up a Hard Drive, and if so, what is the max size?
Does the ST support SCSI hard drives?
Does the ST support IDE hard drives?
Does the ST support a CDROM?

I'd like to use the ST for music sequencing, especially piano. I am also beginning to learn to play the piano. Does anyone know of a good piano teaching software for the ST that utilizes the midi ports?

Thanks for any info you can provide.

what really needs to be done is for one of these companies to market there products in the english markets around the world, that way they can at least stabilize the atari market, once its stabilized, then try to expand it.
they sure are not going to get many new users to buy there computers right away till there is a stable user base with some cool software.
the fastest speed of the computer may not be the most pressing thing even though it is hurting apple, they are in a different situation, they are directly competing with the PEECEE, and there operating architecture is not as good as the atari
i see the atari, and amiga platforms as a kinda gorilla type of platform that can sneak up on a unsuspecting market that really does not even know that they exist.
this will be a longterm thing to undue the damage of the worthless management of the now defunct atari/commodore companies.
the clone manufacturers should be looking at this as a niche market, and promoting there products as a premium platform that has large advantages over the common platform machines, thus stabilizing, and to a small extent in small increments enlarging the base.
there are still some small companies in just about every kind of market that are really stable, and have some growth, and are looked at as the Cadillac of that market, that is how i would promote the clones(but we need a decent browser for that, and upgrade the many fine midi programs out there).
there is not one dealer in a country the size of the u.s.a. that i can pick up the phone, and order a clone, that is insane for a market that they claim they want to sell lots of machines, if they let the dealer base wither away, no matter what they do, they will not be able to crack this market.
i see the atari/amiga platforms as a gift to europe, and the rest of the world from the fine lousey managed companies here in the u.s.a.
it could be handing them the opportunity to gain freedom from the slave PEECEE market that is heavily influenced from the u.s.a.(microsoft), and starting there own homegrown, and managed platforms in which to compete.
thanks,
lance

Well I found STEem and installed it, along with Editrack 7.1. So far I'm unable to read any floppies (perhaps I should RTFM, eh?) and I can't seem to find a way to export SNG files as Midi. STEem also hangs when I try to play an SNG file, but I'm not worried about that. It's pretty cool... I'll have to work with it more tomorrow. Again, thanks for steering me in the right direction...

Good going!

So far
> I'm unable to read any floppies (perhaps I should RTFM, eh?)

Unfortunatly, Steem cannot read Atari formatted discs which is what
your problem is.It reads only Dos-Formatted discs. the gem explorer
program does however.

and I
> can't seem to find a way to export SNG files as Midi.

That is easy. Once you get a SNG file into memory, simply go to FILE
(on the menu) , go to "SAVE SNG/MIDI file" and RIGHT click on that! A
RIGHT click will save it as a Midi File. A LEFT Click will save it as a
SNG file. Easy enough! :-)

STEem also hangs
> when I try to play an SNG file, but I'm not worried about that. It's
> pretty cool... I'll have to work with it more tomorrow. Again, thanks
> for steering me in the right direction...

Thanks for trying it..I beleive it depends on what kind of system you
have as there have been varying reports on different systems. I only
have a 120 MHTZ system and it is too slow on that.

7527. [HELP] PC-Speed installation instructions

Newsgroup: comp.sys.atari.st
Date: 2000-12-26 09:08:29 UTC
From: french-lines@usa.net
Message-ID: <929n6c$1dl$1@nnrp1.deja.com>
Source record: 52745

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

URGENT !

I would suggest you save all that can be saved NOW (I mean right NOW),
before your disk crashes totally... Yes, disks do die, as we all do...
Now the problem is to replace the disk... Not very easy, these days,
with those old type drives...

If you can make up a boot disk up try booting up
using that.You can try and force the computer to
boot from the 'A:' drive by holding down the
<Alt> key on switch on and keeping it depressed
until it starts booting from that drive.This
might enable you to get at the 'C:' partition on
its own.

>any help I can get. Need help with the following?
>
>What kind of monitor do I need for my Atari ST? Is a TV ok?

Hiya

A tv is fine for games, but for serious applications a monitor is much
kinder on the eyes, and for music (Cubase) a hi res monitor is ideal.

>How can I tell how much RAM I have?

4 meg, BUT can have 16 meg with additional hardware. STE's are easily
upgraded and may be cheaper than upgrading STF/FM/m's.

>What is the latest version of TOS I can run on my 1040STe?

to my knowledge TOS 2.06, but you should have TOS 1.62 as standard
(older STE's have 1.06 which has a minor bug or 2) and then have 2.06
switchable for compatibility.

>What upgrades can I purchase for my STe?

TOS 2.06, hardware accelerators, pc emulators, serial port upgrades...

>What is the max video resolution I can achieve?

Hi-res 2 colour, med res 4 colour, low res 16 colour, (bugger can't
remember the specs... it's on the tip of me tongue an all)

>Can I hook up a Hard Drive, and if so, what is the max size?

Yes. Partition size varies on software and TOS used.

>Does the ST support SCSI hard drives?

Yes with an adaptor like the Link II, top link etc..

>Does the ST support IDE hard drives?

Yes. internal as well.

>Does the ST support a CDROM?

Yes SCSI, but generally you need a SCSI adaptor as you would do with the hard drive (as a rule only 1 is needed). You will then need a cd-rom driver such as extendos or spin!

I use 3 x Pioneer CD-ROM Changers giving access to 18 cd's at one time, so that should give you an idea of the scope.

Adding a SCSI adaptor enables you to use other devices: Optical drives, removable ez and zip disk drives, even Panasonics PD drive which encorportates a optical and cd drive in one unit!

> am interested in getting back into the Atari scene but am looking for
> any help I can get. Need help with the following?

Hi,welcome back.

> What kind of monitor do I need for my Atari ST? Is a TV ok?

A TV is o.k. but for serious work try and find an Atari Med-Rez monitor
or,better still,get a cheap SVGA monitor and buy an adaptor (such
as the ones ASP sells) and run in Hi-Rez (B/W only)

> How can I tell how much RAM I have?

Without opening up the machine get an analysis program such as profile
or stdata etc.There are PD vendors on this Newsgroup who could provide
you with one.

> What is the latest version of TOS I can run on my 1040STe?

TOS2.06 with a bit of fiddling

> What upgrades can I purchase for my STe?

Memory,TOS,Keyboard,drive interfaces,high density disk modules.Quite a
few in fact.

> What is the max video resolution I can achieve?

ST High without machine modification (680x400?)

> Can I hook up a Hard Drive, and if so, what is the max size?

Yes you can.SCSI using a link interface or similar,IDE by using an
internal interface such as the one from Mario Becroft.Size will most
likely be determined by the software you will be using (HD Driver is
reckoned to be the best)

> Does the ST support a CDROM?

Yes.See answer to previous question

> I'd like to use the ST for music sequencing, especially piano. I am
> also beginning to learn to play the piano. Does anyone know of a good
> piano teaching software for the ST that utilizes the midi ports?

Can't help ref: the piano teaching bit but many choices in the
sequencing depatment.

Thanks to everyone for your advice on getting my hard drive going again. What eventually worked was what I had been trying numerous times unsuccessfully: rebooting from the hard drive utilities disk in the A: drive, re-nstalling the drive, etc.
The problem was, I'd do that, but when I'd click on the C: drive icon, I got the message that no such drive existed. I figured I was doing something wrong. After you guys affirmed I was doing it right, I just kept at it until one time it eventually saw the drive.
I'd already checked the cables so knew that wasn't the problem, so why it wasn't seeing the drive then eventually did is a mystery to me. The same thing happened last year to me on my other ST and hard drive, and the solution eventually was the same: 20 or 30 tries, and it eventually saw the drive.
I take it others haven't run into this problem much, so I'm guessing it might be related to the "Atari Advanced Hard Disk Utilities" drivers I use, if not the guy behind the keyboard.

7536. AtariWorks

Newsgroup: comp.sys.atari.st
Date: 2000-12-26 15:39:19 UTC
From: James Pinson <jlpinson@dundee.net>
Message-ID: <B66E25D5.2DCD%jlpinson@dundee.net>
Source record: 52756

Have any of you successfully installed AtariWorks to your hard drive?
After I got my hard drive running again (see my previous messages), I tried installing this program but ran into problems.
I ran the install program from the first disk. Things seemed to be going smoothly. It installed files, prompted me for disk two, installed more files, then prompted me for disk three and installed those files, too. Then, when it was done and I clicked on the works.prg file on my hard drive, I got the screen bombs routine.
Oddly, the program runs fine off the installation disk in the A: drive, although it won't again when I copy that file into the Works directory on my hard drive.
I know it's not my hard drive itself because I've tried installing this on a different (physical) hard drive, and the same thing happened.
I've also tried moving files around every way I can imagine and have discovered that the works.prg file will run if it's not in the Works directory where the installer puts it, but that if it's not there, then the program can't find the spelling and thesaurus files, even when you add their location to the path statement for them in the program.
Any ideas?
Thanks.

I found out the floppy dilemma when I read the FAQ... after I posted of course....;-) I can just copy my files to the TT and back onto DOS floppies then.

Ahh the right click... didn't think of that. I'll give that a try... after I cede control of the computer to my son for a while (don't want him to miss any urgent messages from the GamesFAQ boards...yeah, right).

STEem chugs along pretty good on this machine (overclocked to 923). I maxed out the speed to 128mhz in the settings, although I notice that they recommend running at 8mhz(!) for most things. I'll have to fool with that a bit later.

>

A program that does this comes with multitos and is called Alert. There is
a better alternative program that does the same thing called Newalert
(from memory). Otherwise the messages just appear on the console, which is
fine if you have the console on another screen, or use xconout2 and
toswin2 to put the console output in a window.

because PC's are notoriously bad with serial connections. I've
seen situations in the past where we had to set the speed to 32k on the
serial port to get the NULL modem to work at all, anything faster and too
many packets would be dropped to make it worthwhile.

Ahh... Thanks, Dennis! Not sure I can find a Philips service center
in the U.S., but I can try...

>the PowerCD can be attached to a TV by means of a simple RF adapter cable
>(the same thing that connects an ST to a TV). You have to set the TV to
>channel 36 to get a picture.

Uhh... didn't catch that. The connection on the back of the PowerCD
is like a 6-pin DIN (circular pattern). I connect my STfm to a TV
with either a RCA cable (from the modulator) or a 13-pin DIN ST monitor
connector.

The problem is probably bearings. Turn the drive upside down,
offload everything you can, and replace the drive. If all else
fails, I would try Best in the US of A. Not cheap, but available.

Cheaper for an 060? I've seen nothing but 060's become rarer to
get ahold of and more expensive in the last couple of years.

Personally I'd be just as happy with a PowerPC motherboard that we
could run our software on instead of an accelerator for atari hardware.
But since it seems like we will never see one of these, I guess something
like this is a valid route.

But its a DIGITAL monitor, 2 Bits per colour. You STE only outputs Analogue Video. I can't remember
how many possible colours there are but I know its more than the 64 the EGA will display.

I suppose you might get it to do MONO but I don't think the line rate on the EGA is fast enough for that.

Dave.

Hello,

I boot my falcon, but do not get the proper desktop.
I get floppy A and floppy B icons along with trash can.

I cannot access my IDE internal drive.

I got in last night my holding down the CNTRL key after a reset.
everything worked fine.

But tonight I cannot get in at all.

Does anyone know what would be causing this?

thanks for your help.

This one has been around for awhile. I had forgotten all about it!

Thanks for reminding us. I think it is based at the University of Kentucky.

Will have to check it out.

Steve,

Have you tried searching for some FREE News servers?

Most only allow you to download, but ever now and then you'll find one
that will let you post as well.

I use Atariworks on my Falcon and have installed it a few times.
Never had any problems. I really like the WordProcessor part.
It's Cool being able to record messages into your text documents if you
have a Falcon!

Wish there was a way to use it as an online/offline newsreader/editor in
programs like Newsie.

It would be cool to use the recording feature to attach voice messages to
e-mails and news group postings!

What is the lastest version of the CenTurbo II B Flash?
I think I have it but want to make sure.

Will there be any upgrades?

Also, has anyone found that some programs won't run with the last version
that will with the next to the last version?

And has anyone tried using anyother 3rd party hardware board with the
CT2B, like the Expose or etc?

Success! Using the Gem Explorer prog I found at your site, I was able to copy the first batch of files from an Atari floppy to a folder in the STEem virtual drive. Opened it in Editrack, flattened the chains and exported as Midi 0. Opened that in Cakewalk. My problem now is figuring out patches and channel assignments (not to mention filtering out some of the god-awful noodling - these tracks are 13 years old and I'm sure I was having fun at the time).

I'm still going to try to get SMPTE/Editrack up and running on the TT when I have time, cause they remain pretty good programs even compared to today's slick sequencers. Right now STEem locks up when I hit play, but perhaps that will be addressed in the future.

Now I can go to sleep. Thanks once more....

>So would I, I can only guess how fast a 68060/100Mhz *would* be, since it
>doesn't exist, but I do know that a 603/200Mhz running in native PPC mode
>will not even come close, under emulation it will barely be faster if not

Then you 'know' very wrong.
(Well, I've not checked out the 603, but if you had taken the time you
would have noticed that the chip we're talking about uses the 603e core.
Even the 603 could not be nearly as slow as the '060, though.)

If you click on the appropriate link on Cortex's Tempest page, you'll
get to Motorola's page on the MPC8240. Among lots of other interesting
information, that page says that the chip is capable of 375 MIPS
(Dhrystone 2.1) at 266 MHz. Let's say around 280 MIPS at 200 MHz.
(http://www.mot.com/SPS/PowerPC/products/semiconductor/cpu/8240.html)

Now, step over to the 68000 page and you'll see that Motorola only
claims 110 MIPS for that (presumably also Dhrystone 2.1). They don't
say if that is for the 50, 60, or 75 MHz version, but it would be rather
unusual to specify such numbers for other than the top performer.
(http://e-www.motorola.com/webapp/sps/prod_cat/sel_guide.jsp?catId=M934310184622)

So, rather than 'not even come close', it looks like the Tempest PPC
will be more than twice as fast!

>slower than a Milan or Hades040.

And where have you learned all there is to know about the emulation
software used with the Tempest?
It is nothing like the usual 'interpret one instruction at a time'
variety you'll find in most (all?) 68k emulators for the PC.

>>The way it's supposed to work is, when you run programs on it, it interprets
>>the programs as much as possible into PPC code and saves a separate program
>>file that runs directly on the PPC. What can't be interpreted runs through
>>an emulator, which they say is quite fast compared to older emulation

>>software. They say it's possible that some programs will run faster each
>>time they're run, as sections of the program get progressively translated.
>???
>I would love to know what programs will run faster each time they're run, you
>do realise that this is messing with the law of physics? If they can pull it

It's not messing with any laws whatsoever.

Obviously, the first time a program is run no translation has been done,
so the processor must spend time on that. Next time it won't have to. QED

>Come to think of it.... they're gonna get two Nobelprices!! just imagine...
>These guys are claiming they've found a way to speed up a processor merely
>by writing some "super-code" for it, well IBM and Motorola will be very

See above.

>I'm not the expert... they're people here which have a much bigger knowledge
>on the topic, I'm just using some common sense. A 603/200Mhz *can't* possibly
>be any faster then a 68060, not in pure speed and power anyway. It might be

Motorola disagrees, which you could easily have found out if you'd taken
a few minutes to look up some facts.

>faster at doing floating point calculations but that's beside the point.

Dhrystone MIPS do not include any floating point calculations whatsoever.
Like most benchmarks it's not terribly good, but Motorola apparently
think it's good enough for rating their processors.

>Talking about dead ends... that PPC603 has had it's best time as well, if you
>ask me.

I doubt many people would use the actual 603e in new designs, but this is
an integrated version we're talking about.
Certainly not something you'd put in a performance machine, but it's cheap
and a lot faster than the current alternatives in the Atari market.

>Just ask yourself the question who's going to recompile what... even if some
>programmers were willing to rewrite their programs, they'll need the proper

The neat thing with an 'Atari' with a PPC is that you'd still have the
same OS etc as with the 68k machines. There should be very little need
for rewriting anything (except assembly stuff, obviously).
I wouldn't really expect any of the commercial software to be recompiled,
though.

>tools, who's going to write the programming software? compilers, debuggers,

GCC has been ported for the PPC, of course.
Debuggers may be a problem for a while, though.

>editors etc...

Normal software will run fine under emulation, or at worst on the original
Falcon processor which is still usable with the Tempest.

>>My personal opinion is that the only real progress we can make at this point
>>for the future,is to move to another CPU type that is actively supported and

>Without Atari software written/ported to run in native PPC code, there's no
>real advantage in this for the user. Production of the 68000 has stopped ages
>ago, but they're still in supply, same thing for the 6502 which drives the
>Atari 800/XL/XE, it wont be any different for the 68060.

I wouldn't be so sure of that, since the '060 is a very expensive chip
compared to the 68000 or 6502. Also, not much hardware ever used the '060,
while there were millions upon millions of 68000 and 6502 machines.
Anyway, the '060 isn't likely to get any faster and it's _very_ slow by
today's standards (not that a 200 MHz 603e is all that much better, but at
least it's a first step away from the dead end 68k series).

>What you're proposing is to drop compatibility in favour of raw power. I can
>see your point, but considering that a clone with a real 68060 will run even
>faster then the 603/200 while retaining software compatibility, I think it's

See above.

Hi,
I was recently given a non-working STe, I opened it up to check out the memory etc and thought I could try exchanging the TOS rom chip in my STe to see if it would be a more recent version.

Would someone be able to tell me which chip I am looking for and how to tell what TOS revision it is (and if I can do this at all??).....

Regards

baz

Hi Dennis,

> No way... Mac PPC's with a 603/200Mhz can barely emulate an 68040. It's only
> faster when the PPC is actually used, since there isn't any software you'll
> have to run the card in the other mode => 68030. Who on earth do you expect

Your statement is true if you are thinking about the old emulation that
Apple did. This engine emulate a 68040 much the same way as ST emulators
emulate the 68000.

I have made my own engine that analyze the 680x0 machine code and
rewrite it into PPC code before it actually is run. The net speed of the
code after the analyzer has run is equal to a 100MHz 060 on the 200MHz
603e.

Best regards
Sven Karlsson / Istari Software

Hi Hallward,

I'm sending this to you as well as to the newsgroup as I think that the
answers to these questions are interesting to the news readers as well.

> 1) How will this affect software compatibility? As no PPC enhanced
> software exists for the ST I assume that 68K emulation is used for the
> most part, and even though this doesn't take advantage of the processor
> to its full extent I'm sure the speed boost is more than adequate.
> (even a modest ST is more efficient than the average PC or Mac in many
> cases as we all know!).

Yes, the emulation engine will be used. Much the same as in the Falcon.

> 2) Software compatibility again... I'll be using the MIDI sequencer
> Notator SL a lot with my Mega ST 4. How will such an accelerator work in
> this case? Will I have to switch it off when running Notator? Will I
> have to forget about even installing it, or will it boost the
> performance like it should?
> Notator doesn't work on anything but regular STs -not even the Falcon or
> TT, so I have a feeling an accelerator like this will make it
> incompatible, but you never know...

I'll have to look into that specific application to see if there is any
problem but I doubt it. In any case the emulation engine is flexible
enough to be "downgraded" into emulating a 68000 however very fast.
Without looking at the application code I would think that Notator will
work on the Tempest+Destiny combo.

Best regards
Sven

7577. CD-R/CD-RW questions

Newsgroup: comp.sys.atari.st
Date: 2000-12-27 16:39:30 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <6Xo26.1908$s4.1133@news.indigo.ie>
Source record: 52654

Hi all!

Some of these questions are going to seem rather daft, but then I was never one to do things the easy way! My poor old Falcon is generally subjected to, "now what weird and wonderful things can we do with you today!"

I have seen a number of CD-RW/CD-R drives available for quite a reasonable price on the second hand market so I have been tempted to invest in one. I understand that to record CDs you generally need enough hard disk space to create an image of the CD first. And this is my slight problem.

At the moment all I have is an internal 540MB disk in my falcon, and an external SCSI Zip 100 drive. I notice that some of the software available like CD-Recorder Pro allows audio/data files to be sourced on different partitions. So my question is does the ENTIRE CD-image have to be in the same place.

Put another way, would it be possible to copy say 500MB of files/audio from the internal drive and the other 100MB from the ZIP onto a CD-R/CD-RW?

I know this could be written to a multi-session CD no problem: but are such CDs readable by normal audio-cd players?

I guess I could upgrade my internal hard disk first, but just thought I would check out the possibility of this route first, as it would save a lot of pain (and cash!)

Thanks for any help, and merry Christmas!

Thats the prob, i need to be able to post, and in the short time i had i couldnt find any, except one where i registered and was confirmed as registered but were still blocked from posting, bloody usefull..

Perhaps peop's could post what servers they are using to give someone the opportunity of investigating their portability.

Hello Ken,
I have the same problem with my Falcon, now and then , during the boot, I hear a click and instead of the desktop with the usual harddisk partitions I only get the standard desktop just like you. My Atari dealer doesn`t know what causes this problem.

Cheers
Dan

Hey, I found that it is ok in this group to announce that you have Atari computer items for sale, but you will be far better off selling the items on Ebay in the long run. Most of the users here know what TOS items are worth, but that isn't the point, it's what someone willing to pay to have them. I have Atari hardware that would make a lot of users drool, but if it ever goes up for sale, it will be on Ebay. I paid big dollars for limited production hardware, and know that eventually I will get money back. Plus, you don't have to deal with the whining about shipping cost and such after you have agreed to make the sale.
The other option, (which I would use in the case of your simms) is to make a charitable contribution to one of the few Atari clubs that legally hold that status. Write the original price off your taxes. There are a few of those clubs still out there.

3 working Expose'
Afterburner at 40Mhz
Mighty Sonic at 40Mhz
Falcon Rack
CLab Mark-X
3 working Falcon NOVA Mach 64's
14mb Atari Sparrow

And that is just the hard to find stuff...wipe your chin:)

Send it to me and I'll sort you out a
good cooling solution.

> I have seen a number of CD-RW/CD-R drives available for quite a reasonable
> price on the second hand market so I have been tempted to invest in one.

Bah! Don't touch second-hand CD-R(W)
with a barge pole unless you know its
history, or it's really so outrageously cheap
that it's worth it for spares. CD-R(W) drives
have a lower average MTBF rating than their
read-only counterparts and you can be almost
sure that the only reason one would be for sale
cheap is that it doesn't work properly
any more.

> I
> understand that to record CDs you generally need enough hard disk space to
> create an image of the CD first.

No, SoundPool CDRecorder Pro can
do it disc-to-disc real-time.
And this is my slight problem.

> At the moment all I have is an internal 540MB disk in my falcon,

That'll be a 2.5" unless you've
modified it. Will work for CD-R
but for best results a 3.5" is
recommended, you've certainly
got room for one inside a MKX.

> and an
> external SCSI Zip 100 drive. I notice that some of the software available
like
> CD-Recorder Pro allows audio/data files to be sourced on different
partitions.

> So my question is does the ENTIRE CD-image have to be in the same place.

Yes, the whole point of making an
image file is for data stream continuity,
but software like SoundPool CD-RP
can do it on the fly anyway, and
Anodyne's CDWriter can pull audio
files from different places all over your
file system real-time, too.

> Put another way, would it be possible to copy say 500MB of files/audio
from the
> internal drive and the other 100MB from the ZIP onto a CD-R/CD-RW?

That's heading for trouble. Do yourself
a favour and treat your Falcon to a new
faster and larger hard disk.

> I know this could be written to a multi-session CD no problem: but are
such CDs
> readable by normal audio-cd players?

No.

> I guess I could upgrade my internal hard disk first, but just thought I
would

pain
> (and cash!)

Pain is often the consequence of
saving cash - not to say there is no
such thing as a good deal, you just
have to be careful.

Hi baz,

B>Would someone be able to tell me which chip I am looking for and how to
B>tell what TOS revision it is (and if I can do this at all??).....
should be two 1-MBit-roms, I think. (512k, partially used)

But regarding the production time of STEs I'm afraid that there aren't
different TOS versions for the STE computer. All should be 1.06.

But have a look at the leftmost desktop menu (that with the ACCs) and
click on the uppermost menu. It will give you the TOS info dialog, and
a couple of (copyright) years should be given. And the most recent
year will give the hint to any STE owner what version you're running.

I'm sorry I can't help you there but I never had an English TOS in
ROMs.

Right now, I click on START.PRG (of the demo)
and it loads to a black screen. It used to at least
load to the intro, then didn't actually get into the
game as I recall.

In between doing that I've upgraded from
NVDI 5.02 to 5.03, which has the side-effect
that if CENTSCREEN is not installed, in turbo mode
I boot to a desktop that's totally devoid of text
and icons. Very strange.

Apart from that, I found that CENTSCREEN
clashed with one or two games. Very rare.

So it looks like I have to remove NVDI and
CENTSCREEN to make this work. I'll try that
right now (the problem being that these two
programs are pretty much essential to having
a machine that makes visual sense when running
in CT2 turbo mode).

OK, disabled everything (taking my own advice)
except DSP_IRQ, and set fast RAM flags to off,
and it loads OK. Must have been last time I was
messing around trying to make it work

Do you have the full version? This is a "Pre-preview"
Doesn't do a lot except show all the different ships
and some long story. Right, I can't be bothered
with this, it's not responding to anything. Reboot
and get on with other things...

Hi Phantomm,

P>I really like the WordProcessor part.
so do I for the data base part. :-)

Right now, I had a look at my original #1 disk. As the INSTALL.DAT
file only gives the disk numbers and the corresponding files, I'm
really sure that the INSTALL.PRG won't do anything but copy all
files from floppy to disk!

Therefore the reason why Jim's WORKS.PRG didn't launch correctly IMHO
should be found elsewhere. :-(

Finally I'll give you my directory structure:
H:\WORKS\WORKS.PRG
\WORKS.INF
\POP.STD (my peronal data base of popular music cds)
and a couple of more personal files
\WORKS\WORKSYS\GERMAN.OVL
\GRM23.LEX
\GRM93.THS
\USER.DIC

You don't say which hard disk driver you are using. With most of them
you can press [Control] to bypass all AUTO folder programs, and holding
down [Alternate] boots from the floppy. I hope you have kept a copy of
your hard driver on floppy! If so, boot from that, install new icons on
the desktop the usual way, and you can start up the hard disk and access
it as normal to delete the program...

Actaully you could use the space on your Zip disk too. I ran CDISO and
backed up my IDE hard drive. I used my 1 GIG Jaz drive for the image file.

>At the moment all I have is an internal 540MB disk in my falcon, and an

I use CDBackup and CDISO. As far as I know CDBackup does not do the image
file thing. CDISO does and you can only choose one partition.

>Put another way, would it be possible to copy say 500MB of files/audio from the
>internal drive and the other 100MB from the ZIP onto a CD-R/CD-RW?

Yes, I could do that with my setup.

>I know this could be written to a multi-session CD no problem: but are such CDs
>readable by normal audio-cd players?

Well I also have CDWriter for burning audio CD's. I can read multi-session
CD's using a CPX file from Anodnye, but only one sessions at a time can be
read. I would think if it would be possible for a normal audio CD player to
read a multi-session CD, but it would only the read the first session that
was recorded (my opinion) if there are compatible audio files on that
session.

> problem.

Hi,
This can happen occasionally (don't ask me why). It's happened me with my Falcon several times - but if it happens frequently, I'd suspect that the harddisk is about to die on you. Listen to the HD. Do you hear that it starts spinning when you start the Falcon (might be a bit hard to recognise since there's a noisy fan inside the Falcon too...) - and then it clicks one or a couple of times, stops and then starts spinning again - just to repeat again and again? Then you've already got yourself a dead drive :(
Otherwise, the next time you manage to get in contact, make a backup of everything important and then get a new HD or borrow another HD for testing to verify that this is the cause.
There could be other explanations, but this is what springs to mind immediately.

Best regards,
Claes

>Thanks to all who can help!!

Hi Trampa!

Yes, I have used Harly 1, 2 and 3. I believe the date bug had to do with the HiSoft file selector. In 3, you can have preset macros to which you can add, recording as many text macros as you have key combinations for:

Double-click on the Macro icon on the Harlekin 'desktop' to open the macro editor window, showing all existing macros. The program is normally supplied with macros for all the Harlekin modules and you can edit them by double-clicking on an entry and then entering the key combinations when invited.

In addition you can record your own text and keypress macros: To record a text macro, press the keys that have been assigned to turn Record macro on - by default Ctrl+Alt+Esc, though I use Alt+Esc - and this will display a cassette symbol at top left of the menubar. When you have finished inputting the macro keystrokes (up to 100 keypresses, which can be text and/or modifier keys Shift, Ctrl, Alt etc) press the Record macro key combination again. The cassette icon will change to a key icon and the next key or key-combination you press will be assigned the string you have entered. I usually use a character I'm unlikely to need, such as an accent or tilde etc. or unusual combinations with Ctrl or Alt - though those are not available for all non-alphabetic characters. To delete a macro, highlight it and press the Delete key.

Once you have your macros, you can save them with the File menu in the Macro editor, normally with a MAC extender. You can save your custom file and load various different MAC files when required.

Regards, /Peter/
The Options in the Edit menu
are fairly self-explanatory.

before I release it.

Also if you have not already given me your IDE HD model/make
for the HYP, now would be a good time. I'm also
collecting Serial Numbers, the SN: from the GEM Desktops
"Desktop Info". A theory of mine is that the serial numbers
might give clues to how many Hades have been sold, assuming
I got enough responces. The Serial Number list is a combination
contact list as well, so if you wish to have your contact info
in the HYP as well I need your e-mail address and URL.

Thanks.

I'd rather buy a new one. You don't know where a used one has been. It may be so worn out that you can only burn a few CD's before it breaks down...

> I
> understand that to record CDs you generally need enough hard disk space to
> create an image of the CD first. And this is my slight problem.
>
> At the moment all I have is an internal 540MB disk in my falcon, and an
> external SCSI Zip 100 drive. I notice that some of the software available
like
> CD-Recorder Pro allows audio/data files to be sourced on different
partitions.
> So my question is does the ENTIRE CD-image have to be in the same place.

If you use the Image option, you must have the whole image on the same partition, yes. Audio burning doesn't require an Image, but data does normally - since the OS is too slow when you dive into sub-folders :(
By the way; If you plan on burning a lot of audio, get the audio version of CDRecorder also - and not only Pro. Pro has a meager audio support and doesn't allow you to change pauses between songs (they're always set to 2 s), doesn't allow you to edit PQ data like ISRC-number, doesn't allow you to insert Indexes etc... The Audio version does in fact have everything you need for making a perfect audio-CD...

> Put another way, would it be possible to copy say 500MB of files/audio
from the
> internal drive and the other 100MB from the ZIP onto a CD-R/CD-RW?

No problem. CDRecorder doesn't care where the audio files are located, as long as they're stereo files in 44.1kHz. The files can be located on 10 different disks if needed, but they all have to be available directly (so you can't exchange a Zip-disk while the program is burning a file from the internal HD...). Don't keep them in sub-sub-sub-folders though. Just one or maybe two levels down.

> I know this could be written to a multi-session CD no problem: but are
such CDs
> readable by normal audio-cd players?

You can do Multi-session CD's, so you'll start with as much as you have room for and then start another session etc until you've filled the CD. One annoying thing about doing it that way is that the drivers for CD which I

know of for the Falcon can only handle one session at a time and you have to choose which one in a CPX... However, this is only valid for data CD's. Audio is a whole other matter and they can't be burned as multi-session. If you want to write one song at a time, you'll need Track-at-once functionality, which doesn't exist in CDRecorder from SoundPool. It's no coincidense that it doesn't exist, since Track-at-once can't be used for mass-duplication and it may not work in all CD-players (the CD will probably not be playable at all in an audio CD-player until it's closed) - so it's safer to use Disk-at-once. The sad thing is that you must burn the whole CD at once when using Disk-at-once, so your HD capacity may be a bit small...

> I guess I could upgrade my internal hard disk first, but just thought I would
> check out the possibility of this route first, as it would save a lot of pain
> (and cash!)

Don't upgrade the internal disk! Since it's 540MB, I suspect that you've got a C-lab MKII with a built-in 540MB 2.5" SCSI-disk. 2.5" SCSI-drives are terribly expensive, so I'd suggest that you add an external SCSI-disk instead. If you remove the internal SCSI, to make room for an IDE-disk instead, keep in mind that Cubase Audio MUST use a SCSI-disk - and that the internally mounted SCSI drive means that the internal termination of the SCSI-bus has been removed at the factory and has to be fixed before you can attach any external SCSI-units.
Otherwise, it would be nice to have a 3.5" IDE instead (there are drives around, which are small enough to be mounted internally). With a 3.5" IDE, you might even be able to burn at 4X if lucky...
Get the right CD-burner! All brands and models aren't supported. Keep to Yamaha to be sure...
Here is a list of CD-burners which are supported by CDRecorder: http://www.soundpool.de/writer.txt . They've forgotten to add Yamaha 8424S, which also works nicely...

Hard drives are like old cars, they will refuse to start if left unused for a long time. If you get your hard drive to work, never ever turn your computer off. It happened to me once, I could boot from time to time and later it would never boot anymore. Keep trying, shake your falcon a bit and if you get it working immediately back up all your data and change the hard drive.

Me thinks that my 933MHz PC can take that 115Kbps speed.
The motherboard specs seems to say it's a 16550 plus UART chip (what ever that means).
Anyway, I don't think that any packets was dropped as the error count was 0 and I was monitoring it for about 5-10 minutes before I started monitor another screen ... TV :-)
I wonder if it's something to do with zmodem protocol.

Ken,

Your problem sounds like your power supply. Check the capacitors on the
power supply and replace the one that make the noise when you power on
the Falcon. Ive had to do this a few times.

Don

I was looking at some laser printer for the office.
The specs blow me down... they are way better than my falc!
for example:
a HP model runs on 133MHz Risc cpu, max 192MB ram, 2GB or more HDD.
Ports incl. IEEE 1284-compliant bidirectional parallel, RS-232 9-pin serial, 2 PCI-based EIO slots, Fast Infrared, Ethernet 10/100Base-TX in 1 EIO slot, USB in EIO slot.

<serious mode off>
I wonder if there's an Atari emulator for this printer

ciao...

IF I were in hardware mode I would remember, I could look it up
if it really mattered ;) But yes that chip should handle 115k, if you
have a decent bios that chip should handle 230k.

Possible, but it doesn't conflict that much with my experience in
the past. There is a conflict that occurs somewhere along the line and if
you slow the PC serial port down the actual transfer rate increases. This
was what we saw on 486's, a media gx and most recently a P2 400. I didn't
have this sort of problem null modem to a mac and even the mac people will
admit that mac serial isn't everything it could be.

As to the zmodem, that is possible as well. Back in the bbs days
we always used to use ymodem 1k, actually generally gave us a better
through put.

You CAN write multi-session audio CDs, but it would be pointless if
you plan to play them in "normal" audio CD players.

A "normal" audio player can only see the FIRST session on the disc.
Other sessions would just be ignored.

I'm not familiar with the Falcon CD applications, but the way to write
"compilation" audio discs where you can't write the entire disc at
once is to write "Track at Once", and leave the session open after
writing each track.

That way you can "rip" one track at a time from a CD to your hard
drive and record that track to the blank CD before ripping the next
track and overwriting the first track on the hard drive. You'll only
need enough hard drive space to hold one audio track.

When you record the last track, you close the session, and the disc,
so the disc can be played in an audio player.

Hello,

Thanks for your input.
The CNTRL key "trick" does not work anymore.
I am running HDDriver.

The next time I got in by making an auto folder with AHDI.prg
Then I booted from the floppy.

That I got me in. I copied all of my IDE partitions to my SCSI drive.
I don't want to backup because I think there may be a corrupted file
somewhere.

But now booting from the file does not seem to work either.
I have to click on the auto folder then click on AHDI.prg
Then I have to install an icon for the Hard drive.

Well when I got in, I have some odd looking folders.
Like Auto'`
Its hard to explain, odd characters after the name of the folder.
I try to delete them, but I get the message "illegal operation"
I double click on them and they wont open.
HdDriver folder is fine. It boots but I get a message.
Something about missing XHDI. I think.

I think I will try to access my scsi drive, then possibly zero
the corrupted partition one the IDE.

I hope it is just the drive going bad. I am just about to
replace it with either 315 or a 2 gig.

thanks

ken

>Apart from that, I found that CENTSCREEN
>clashed with one or two games. Very rare.

I never got Centscreen to work properly - pick your choice from having part of the screen duplicated to the right of the screen or loads of pixel garbage at the bottom of the screen. Give me Videlity any day, harder to set up but it works!

>Do you have the full version? This is a "Pre-preview"
>Doesn't do a lot except show all the different ships

Yep, full version. I'm not that taken with it. It's too slow to get into the game and there doesn't seem to be anything much to do :-(

Sorry, I have more problems with Sting, CAB and the other internet programs
than with getting the VME card going.

Thanks for the help, I have NVDI 5 that I got with a Mega STE so I will try
that and see if it works.

I already have Magic installed, will NVDI install ontop OK?

Anyone know were how to set this up or what the general process is?

The drivers I have are in German and would appear to be very basic and not
very good, using these the best I got out of the card was a messed up mono
output.

Would fVDI do any better? (from the Eclipse)

Magic PC is a version of magic that runs directly on a PC, Gemulator is an ST Emulator they will not work together in the manor you talk about.

If you want to run Magic only then use Magic PC, if you want to use Gemulator with Magic then you need a standard ST Magic (as it were).

> What is the max video resolution I can achieve?

Normally

ST Low 320x200x16
ST Med 640x200x4
ST High 640x400x2 (mono)

You can also interlace these with a number of programs;

ST Low 320x400x16
ST Med 640x400x4
ST High 640x800x2 (mono)

But it should be noted that this does look bad unless you have a good SVGA in mono as Med and Low have to low a frequency to give a good picture.

You could also consider a SCART lead and TV, this produces much much better results than a standard TV lead thing (forget the actual term something like OHF, ohhh now I am in my own personal hell).

You could also convert an old monitor from say an Amstrad 464 (colour one), this is simply RGB to each RGB (I think you need a little resistor as he signal is a bit strong), H and V sync to the sync line (I think that Amstrad monitors only have one sync line) and the other things like ground to ground, simple.

Heads can also get stuck and fail to come out, if the disk spins but you get no clicking then this could be the problem. This has happened to me on a number of IDE 3.5" drives, the only solution I found was to 'drop' the unit (the HD) on its side from about 1", note that the drive needs to be replaced in that case.

I does also sound like it could be a driver problem, do not go out and buy a new one until you have tried re-formatting, etc. with HDDriver.

It should not be a problem, I think that the STE only had one 'layout' of chips for TOS.

You are looking for 2 chips on the right hand side of the computer just under the floppy drive, I believe they are 68 Pin each and will probably have a code on them or (if you are lucky) the TOS version.

If you want to put them into another STE then you should have no problems and may be able to figure out which are the newest from the chips marks (as mentioned above).

You could put some TOS 2.06 chips in if it is important.

Hi Lonny,

> I'm interested in knowing if one puts this into a Hades060 for
> example if the 060 is still available?

Sure!

> Can both be used
> at the same time is what I am wondering.

Yes, you can. The system is effectively turned into a multiprocessor system with one 680x0 (on your case a 060) and a PPC. You can run the emulator on the PPC to get a "second" 680x0.

> Also very curious
> about the furture part. How would native PPC apps exist,
> as some extended binary format?

The PPC runs its own Fenix microkernel that supports full memory protection and virtual memory with demand paging, copy on write and so on. Not all of these features are implemented yet but the framework is there. The kernel also have services making it possible for PPC code to call 680x0 code and perform TOS calls. 680x0 code can also call PPC code via the Kernel. The kernel have extensive thread support and synchronization primitives.The 680x0 emulator itself runs as a process under the kernel.

PPC processes are always run in the user model (VEA) and there is no way processes can leave that. The emulator is a PPC process itself.

ELF binaries can be run with the Fenix loader and since virtual memory is supported by the kernel ELF shared objects (dynamically loaded libraries) is possible although I haven't fully implemented the dynamical linker.

> And will there be some
> development tools available so PPC apps can be made?

GCC and GAS already targets PPC. I'm working on a MonST like debugger that can debug both 680x0 and PPC code.

Speaking of which, I would gladly receive suggestions as to which features the debugger should have. It already can use a vt52 like terminal, raw shifter video and GEM windows as graphical frontends.

> Sorry for so many questions, and of technical nature. ;-)

Don't worry. I don't mind answering questions here unless the crowd out there objects of course.

Best regards
Sven

7626. Re: CD-R/CD-RW questions

Hi Claes,

CH>One annoying thing about doing it that way is that the drivers for CD
CH>which I know of for the Falcon can only handle one session at a time
CH>and you have to choose which one in a CPX...
maybe I misunderstand you, but I think I should object. Here on my TT,
on a multi-session data CD all data are available as on a single
session CD. For the cd rom drive it does make no difference!

I only see previous sessions when using CD Recorder in order to add a
session.

A usual Audio player 'sees' only the first session of a cd. That's the
reason why I use to add non-audio data (e.g., the cover) in a second
session.

CH>They've forgotten to add Yamaha 8424S, which also works nicely...
That's true for CD Recorder from 3.x onwards. I bought that drive and
even the latest version of CD Recorder 2 (floppy dongled and
downloadable from the web) was not able to write with that drive.

So I updated to 3.132. They returned it to me within three days.

Two final remarks: For CDs with no pauses between tracks ('live
recordings') you'll need the Audio version or a corresponding soft
from Anodyne. CD Recorder Audio is _not_ able to write 'mixed mode'
CDs nor CD-Extra, but Audio only! Dic at once, as you mentioned before.

Und TTschï¿½

Right. However, I would not guess that you can get 500+ buyers for a *new*
machine under that conditions.

>Selling a computer with *only* German docs, OS and programs, IMHO is equal
>to committing suicide if one wants to capture a piece of the market. German

The Milan Bootblock, TOS and utilities can be set to english and german (and
the default is english!). TOS supports additional languages and keyboards,
but due to a lack of interest, the RSC files for the desktop may not be
completely translated. At least french should be useable.

>> have?. :-)

>The blinkers are BlueShine v2.93

They'l do!, they'l have to as your a f'in pauper.

>and the three rotors are Fan2000 Server Edition SP56

Hm!, bit ancient, but usually compatible with most crashes.

>with Norton MC68030 >16MHz timing bug fix beta 2.1.44.

And your wondering why you have a problem, tit!!! Youre gonna need 5.2.17
at least, sheduled for release early end of 2002, pending discovery of
plasma-bus modulation technology, this is currenly seen as a hurdle.

>Yesterday I bought HeatSink ME with Extra Cost desktop wallpaper pack
>but that appears to have a conflict with the DSP_IRQ patch

Its supposed to.... Duh!! RTFM, how else would you expect it to move the
bootblock into the reserved read only drive-personality sectors...

>if run more than twice consecutively within 5 minutes

There's your problem, normally it would take longer than that to reinstal
windows, hence you couldnt normally run it twice in 5 minutes, you'l need
to reduce your cache size to slow down HD access so it will take longer
to re-install. Once youve done that it will take longer before you can
get it to crash the system.

>while the sun is shining and I hold a carrot in my left hand.

I also saw you added this to mail in alt.chicken-in-a-box.rumpey-bumbum
in relation to another more personal issue.

>Any ideas?

None that i'm not receiving treatment for.

I don't think the serial numbers will give you a clue about the numbers
of Hades that has been sold so far. There are lots of Hades around which
doesn't have a serialised TOS. My Hades didn't had a serialised TOS when
I bought him back in 1997. I believe the Hades came with a serialised
TOS only from late 1998 on.

A German chap who at that time, early 1999, worked very close together
with Medusa System told me once that so far Medusa had sold 500 Hades.

Anyone got a utility by the "Fingerbobs" called "Bootblock"?
It was made in 1990 and basically writes nice looking bootup screens to
your floppy discs boot block.
I've got a copy, but it's (probably) corrupt as it doesn't work on my
STe, Falcon or TT ! (so I'm guessing it may be STfm only???)

I can email my copy to any STfm owners wanting to test...

Anyway, any help appreciated. Thanks, Steve

It's unlikely ever to be accurate enough
for serious work without totally draining
the host CPU to emulate the timing
precision of a real Atari.

Don't get your hopes up. Stay with
reality for the time being and use the
proper thing.

No - I used too much shorthand there.

- I autosave Magx.inf at every shutdown of MagxDesk.
- When I change Serial CPX and save it I get full use of modem 2. I can close the CPX and re-open it and it stays as modem 2 - that's fine.
- When I shutdown or re-boot, Magx.inf gets saved (window positions etc) but not the serial settings, nor the port, into Magx.inf.
- After the desktop reappears I go to Serial.cpx and I'm back at modem 1 (set to 110baud, 8N1, RTS/CTS) yet again.

<g> Ok.
It seems others are rallying round anyway.

> Thanks for the help, I have NVDI 5 that I got with a Mega STE so I
> will try that and see if it works.
That's the one. There used to be seperate releases of the NVDI version for graphics cards (seperately the version for Matrix cards and the ET4000 version for Crazy Dots and Nova), but now they're all in with the same package (including MagicMac and MagicPC).

>I already have Magic installed, will NVDI install on top OK?
Yes. In fact, because NVDI has its own version of CHGRES I think you _must_ install in that order. I do need to know, though. What software is driving the card at the moment? If you are using Crazy Dots software (CD2_MANA.PRG ?) then you will need to do some preparatory work for NVDI.

Do you have a file NVDIVGA.INF in your Auto folder? If not you'll need to create one with the program VMG4000. If you don't already have it you need to grab a copy. One comes with the NVDI installation, but by the time you get it out it may be too late IYSWIM. Go to Jo Vandeweghe's site to pick up a copy at:

http://www.ping.be/~pin10575/ATARI-E.HTM

> Anyone know were how to set this up or what the general process is?
>
> The drivers I have are in German and would appear to be very basic
> and not very good, using these the best I got out of the card was a
> messed up mono output.
>
> Would fVDI do any better? (from the Eclipse)

First, find the max and min horizontal and vertical frequencies that your monitor can cope with. You may be have to contact the manufacturer if you don't still have the manual.

Run VMG4000 and before anything else go to the Options menu and enter these max/min figures for the Monitor and then ensure Crazy Dots II is selected in the Hardware menu. Save options.

Make sure you read the VMG4000 manual thoroughly, then create a new file and go to the modes menu in order to create a couple of resolutions for each colour depth. If you exceed the limitations of the monitor you will be warned.

Once the modes are created double click on each one in turn, test them, readjust the frame position if you need to (click and hold, then drag) and when you're happy click ok and save.

Eventually you'll get a usable Inf file which goes in the AUTO folder.

Only then install NVDI ET4000. After that it should be possible to tweak the setup.

Hmmm... I just bought a Marantz CD player in the sales for 90ukp. I
don't think it's the latest model by any stretch of the imagination
and it still has "CD Rewritable playback" printed on the fascia.
Depending on how old/capable your CD player is I wouldn't write off
the chances of it being playable.

> I suppose, but it'll not be the programmes taking that space up.

My first three partitions go like this
C [boot] 408 MB(?? Wow! I'd better check this out) (42 MB free)
D [games, demos and personal data] 449 MB (1 MB free)
E [programs] 448 MB (12 MB free)

Then the rest of it on the secondary drive
is audio and video (including one whole
960 MB partition completely dedicated
as a "tape" file for Audio Tracker).

> I'll
> probably find myself cluttering a bit samples folder up with massive
> 16bit 44khz samples. I know, I had about 100mb of samples and they
> were only about 15khz rubbish. I'll go mad when I hear decent sound

Last Updated 12/28/00

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

I have the following Atari Megafiles for sale. These are the hardrives that Atari had manufactured to match the Mega ST series of computer, but they should work with all ST and TT units. All the equipment is cleaned and detailed, and in good or better condition, but without boxes. If you have any questions in regards to unit condition, please feel free to ask. Please make all offers in U.S. funds.

If you are interested in any of these items, please respond to Jim at jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable - 1 unit available
- Atari Megafile 60 - with power supply and cable - 2 units available
- Atari Megafile cable

Well, you're certainly right that there's nothing like the real thing,
but in this case I just needed to open these native Atari files so that
I could resave them as standard midi files, and for the time, effort
and money it took, it worked swell...

Even with the settings maxed out, the speed bar never gets past 50%...
but it worked for what I needed it for...

It means that your POST has been redirected.

To put it in non http language. You have a batch of information
going out from your machine to a server on the net. In the process the
remote end told you not to use it anymore but to switch to a different
server for the transaction.

GET means get the data from the new location. Do not send them
the posted data.

POST just means to send the information to the new location. This
can be a security issue as you are sending information to a site you did
not directly think you were going to send it to. But even IE doesn't
bother to give you the new location that the data is being sent to for you
to make the decision.

Cancel - just cancels the action. No data was sent to the new
site, no information was retrieved from the new site.

Hope that makes sense,

Dan Ackemran
aka baldrick

7661. FS/T: Brand New Atari Jaguar Items

Last Updated 12/28/2000
- Sold/Traded Items Removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - 2 units left
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

> I'm sure I was having fun at the time).

YES...I am glad for your success and that I was able to help in a small
way. I have had the experience of a "rescue Operation" such as this,
but it was with My DX7 patches. I had banks and Banks of stuff I
created on the Yamaha CX5M computer. The system was destroyed in a
fire, but the tapes with the data on it I was able to salvage. A member
of the DX7 List saved me by converting them to standard Sysex for me,
(After I sent him the tapes, and he got out his CX5m) and now they are
available on the Atari-Midi File section.

>
> I'm still going to try to get SMPTE/Editrack up and running on the TT
> when I have time, cause they remain pretty good programs even compared
> to today's slick sequencers.

YES... The barefoot version has some functions that are hard to beat
like the virtual joystick to control Controller messages. Other
programs that work on a TT is DR T's Omega KCS and the 030 version of
Tunesmith as well as M and the David Snow apps. RealTime and master
Tracks Pro also work well. All available on my site.

Right now STEem locks up when I hit play,
> but perhaps that will be addressed in the future.

I belong to the STeem List and have been giving them feedback. A new
version will be out early Jan....so look for it.

>
> Now I can go to sleep. Thanks once more....

Your welcome...now so can I...WHEW!!!

HEY...if you ever want to send me those Editrack files, I would like to
hear some of your work...even if it was 13 years ago!

Happy new Year!

You run the install prog which comes on the master disk, having entered
your serial number and other details it will install the right drivers
(assuming that it has any for your card).

Nope. Newer STes had 1.62 which got rid of the med rez bug, and may
have done a few other patches.

2 chips either 30 pin or 32 pin depending on the size. I think it's
either 1Mbit chips or 256kbit ones, but I'm not sure. Can look up if
it's that important.

>If you want to put them into another STE then you should have no problems
>and may be able to figure out which are the newest from the chips marks (as
>mentioned above).

Jumpers may have to be changed due to the different sizes of ROMs
used. They're actually zero ohm resistors, 3 to the right of the rom
sockets which are changed. The details are on the Atari Schematics.

A 450 MB boot partition? I thought the boot partition was only to be
used for progs/accs that are used on boot up. How did you get to use
nearly 450 MB on programs? I only have about 20-30 modern decent
apps, do you have things like POV installed?

>> I'll

I'll have to buy some decent music software first..

>> And I'll be able to play MP3....
>
>Then probably get sick of it in 10 minutes
>as a hideously large number are so highly
>compressed for reduced transmission time
>that they sound absolutely rubbish.

Yeah, they are a bit pointless but there are a couple of tunes that
I need to download (they're still too big really), namely the one I
made at an IT course using Cubase Audio. I went along and there were
certain divisions; graphics, web design, music etc. So I chose to do
music for the week and I walked in the room and I was appalled. A
300mhz laptop each with 16 bit internal soundcard running cubase
audio. It was crashing every few minutes. If anyone wants a listen
visit the IT courses web site.
You can take the piss if you want, as it was the first time I touched
cubase audio or any decent audio software. Cubase is difficult to get
used to, but it's worth it. Soundforge is prettty nice along with
Fruity Loops. Website (IIRC) is
http://www.sussed.it/webs/Lyndon/index.asp and it's fire.mp3

>What order do you have them in?

SCC should definitely go before Sting; if not, it's useless. Haven't
you read the docs? Sting being launched before SCC, it can't use the new
driver or whatever they call that thing. The message "RSVF supported" in
Sting's Serial CPX tells you that Hsmodem has been correctly installed.
So the order shoud be:

DRVIN
SCC
STING

Silly you.

J-F.

I've seen an Expose refuse to work with CT2
and an Eclipse refuse to work with an
Eagle Sonic accelerator.

Ahh! Cooperation! Gettin' harder to find! As soon as ASH responds
with a price and payment method I'll be getting to experiment with it.
hopefully the English RSC will be enough to make the program usefull.

There must be a curse following people who try to give advice...

Because of a few problems I have in various resolutions I needed to create a new INF file for myself and followed my own advice below. The result is that I'm locked out of my own graphics card.

The only way I can get in is either by removing NVDI (which means I end up in 640*400 mono and can't run VMG4000) or by keeping NVDI and removing NVDIVGA.INF completely and booting to the normal monitor port in 640*480*16 (which is killing me!).

Does anyone know a source for VMG-4000.PRG by Andreas Winter? I've got v1.12 from Jo's site and v1.08 that came with NVDI, but they're dated 1995 and I feel sure there must be something more recent (even only in German).

I'm still experimenting with a way of getting in, but I'm open to any suggestions here... B^<

Hi Steve,
I thought that would've been set up by DRVIN, rather than needing SCC
to be loaded as well, but I've rearranged it anyway and I still get
110 baud on Modem 1...

This is getting really silly...

7692. Misc Atari ST HW/SW FS/Trade (USA)

Newsgroup: comp.sys.atari.st
Date: 2000-12-30 01:45:33 UTC
From: Fred Horvat <fmh@netzero.net>
Message-ID: <3A4D3E3C.70C57BB@netzero.net>
Source record: 52523

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows
3.1
Switch back and forth between TOS and DOS modes $90.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,

box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$30.00

R/C Aerochopper by Ambrosia Microcomputer Products.
This is a R/C Airplane and Helicopter Simulator for the ST.
A Futaba 2 channel controller that plugs into the ST's cartridge
port. With the 2 channel controller it's very realistic. $50.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's
age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk, box, and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Snoopy The Cool Computer Game by The Edge. Snoopy, Woodstock,
and the rest of the Peanuts gang. Linus has lost his blanket
and Snoopy has to find it. Comes with box, docs, and disk
$5.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks
$10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

MISC SOFTWARE

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual.
$3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk
$15.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

CD-ROMS

Whiteline Linux by Delta Labs. Atari Linux Distribution 1.1C.
Run Linux on your TT030, Falcon w/FPU, or 030 ST w/FPU. Has a
very simple installer. Just answer a few questions and away it
goes.
$15.00

NetBSD by InfoMagic. Install this Unix implementation on your Atari
TT030 or Falcon. Besides Atari there is IBM, Amiga, SUN, DEC ALPHA,
Macs, VME, HP3000 distributions on this 2 CD set.
$15.00

WANTED

MagiC Mac Ver 6.XX
CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,

OS/2, Mac, and Amiga. If interested please request a list.

7693. help! falcon Will boot/new problems

Hello,

I went into my falcon today and replaced the stock 80 meg IDE
with a Toshiba 2 gig IDE.
The hard drive installation went very well.
But I made one mistake. I cleaned and lubricated the keys.
I have done this before on an ST4 with no problems.

But on the falcon it is quite a different story.
a lot of the keys are not working. I press and get nothing.

Is it possible to replace the keyboard assembly with an STf keyboard?
Looks like the same case.
Of course the action will not be the same.

It was very interesting to see the inside of a falcon.
After I got it all together, it still would not boot up properly.
I solved the problem after many trials and errors.
I think but am not absolutely sure that my HDDriver.sys file got
corrupted.
After repartitioning and reinstalling the driver, everthing seems
to work just fine.
Except that now I can't type anything.

I would appreciate any suggestions on the keyboard.
thank you.

ken

Iï¿½m not realy sure. If the keyboard had the same connector on short
wires it is no problem. If not, solder works.. :/

Better to had a look around for a used keyboard.

Normaly any atari keyboard is the same (watching connector)
Internal the falcon keyboards are "newer" as an st keyboard and also the
layout is different.

> It was very interesting to see the inside of a falcon.

-> DOITF030 http://www.doitarchive.de

(Contains also the wireing to connect other keyboards)

> After I got it all together, it still would not boot up properly.

Normaly, any falcon boot up without keyboard.

> I think but am not absolutely sure that my HDDriver.sys file got

Install it again and make some tests with copy/read files.

Happy new year 2001

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

Greetings! You're invited to my WebSite. Make yourself welcome! I've
been hard at work, Adding New Pages improving my WebSite while trying
to yield to the K.I.S.S. method. Or (K)eep (I)t (S)imple (S)tupid. As
my Boss and Teacher, "The Shadow" taught me. Currently I'm behind on
adding new inventory to my Catalogs. I have been and will be acquiring
more Atari inventory. 64 Bit Atari Jaguar Game Machines, Classic Atari
8 Bit & Atari ST Computers. HardWare, SoftWare/Games, Books/References
and Accessories. And I Ship anywhere the Law and Customs allow.

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete

Hi Tim...

Well it may be a while before I can untangle the files. Many of them had multiple tunes on differenbt sets of tracks with various chains (some endless). And the original patches were for a TX81Z. In order to export as midi, I need to flatten all of the chains which affects how things repeat, not to mention figuring out which tracks went with each tune. As psychedelia, it's pretty cool... as coherent music, it's a mess right now, but I'm still glad to have the ability to get to the music on my PC.

Obviously, the best real solution would be to find a nice SM124 and hook it up to my old 1040ST, connect the sync box, my Sequential 6-Trak, the TX81Z and old TOM drum machine (I've kept it all over the years) and play the music as it was recorded originally... but I just don't have the time or space to do all that. I'll try working with the midi files first.

I've been using an old Roland MV-30 Studio M for the past 8 years. Nice box... 128 patches, decent drums and a 16 channel automated midi mixer in a 5 pound portable unit. Very capable for the midi stuff, but it's pretty obsolete, too. I'd sure like to get one of the newer mini-disk based portable studios, but I'd better make do with what I've got before I try talking my wife into letting me buy even more stuff... guess that's the trouble with being an old married guy...;-)

I'm sure I'll be around these boards more, now that the Atarian bug has bitten me after all these years....

One of my favorite Synths! Just got one in Mint condition mostly
because you can do microtonal stuff on it, and the Atari Editors let
you edit even THAT!

In order to

You can get a CABLE from BEST ELECTRONICS that lets you use a regular
SVGA Monitor on an Atari. It is about $38.00. Editrack would look nice
on a 21" monitor! The link to Best is on my LINKS page on my site.

but I just
> don't have the time or space to do all that. I'll try working with the

If you get a Monitor switcher then that will take less space. Myself? I
have 4 Atari's and a PC in my studio. Just put up shelving to
accomodate everything. Looks nice. Kinda like Mission control.

>
> I've been using an old Roland MV-30 Studio M for the past 8 years.

Well...you can do a lot with what you got...and sounds like you have
more then a lot of people! I tend to find deals and then "talk my wife
into it" :-) Right now the FM stuff is very cheap, and it sounds good
and Lord knows there are thousands of patches for it on the web!

>
> I'm sure I'll be around these boards more, now that the Atarian bug
has bitten me after all these years....

It's a good time to be back with all this freeware being
released.....and I have to say...THERE IS MORE TO COME!!!!...

in other words...I AINT THRU YET! :-)

>Depending on how old/capable your CD player is I wouldn't write off
>the chances of it being playable.
>

What the "CD Rewritable playback" undoubtedly means is that the drive
will PLAY rewritable discs (CRD/W).

Many home audio CD players cannot play CDR/W discs because their
laser/pickups are not sensitive enough. A "store bought" ("pressed")
CD is far more reflective than a recordable CD, and many home audio
players cannot read the lower reflectivity of a CDR/W.

This drive apparently is one of the ones which address this problem by
having a "multi-read" capability, allowing it to read all types of
CDs, CDRs, and CDR/W discs.

However, even such a "CD Rewritable playback" drive will NOT read more
than one session on a disc, the FIRST session.

This is part of the CD Audio design spec, and really has nothing to do
with how the disc is created.

This is also what allows "multi-media CDs" to operate.

The Audio player reads the FIRST session, which is music, and a
computer CD player will read the LAST session, which can be video, or
still pictures, or whatever.

The SAME disc will work on both players because of the design specs.

Audio is the FIRST session, Data is the LAST session.

Unfortunately for the original poster, this also means multi-session
Audio CDs will NOT work in a normal home Audio CD player.

>>Doesn't do a lot except show all the different ships

>Yep, full version. I'm not that taken with it. It's too slow to get
>into the game and there doesn't seem to be anything much to do :-(

Sounds like you are flying away from the enemies! I remember I did this
myself the first couple of times I played it, the radar doesn't quite work
as you'd expect, there's quite a few missions in it once you get going.

Keep trying and you'll get there! I think it's one of the most impressive
Falcon games about! :))

Cheers!

James

I think you may be getting your GF's knickers in a twist, take them off
and give them back..

It doesnt really matter what the CPX says when it is invoked, providing
the information is correct. When i run my CPX it comes up with the
details for modem1, but selecting modem2 gives the correct details.

Why dont you shelve the 110 bit for a moment and just concentrate on
getting the fastest possible 'normal' speed and work up from there.

>in 640*480*16 (which is killing me!).

Eeek!, pass him a knife, Harry-kirry is required, but post me that MSTE
first.

Anyway, that software must be a right dog. I made sure very early on that
i had Recovery options, so the minimum i get is 1024*768*256 via the VGA
and under TOS. Ive also recently completed a MAGIC/NVDI recovery disk so
i can boot into MAGCI with NVDI from a floppy.

Dont you have a backup of your last working setup somewhere, wont the
default installation give you something to work with?.

Once you get it working, reach for the floppies and make a boot disk.

That's great! All Multi-session CD's I've made DOS-compatible have been recognised completely on my PC, but not on my Falcon where I've had to change session with the CPX I mentioned. The same goes for Atari-format multi-session CD's (with the difference that they can't be read correctly on the PC, naturally...). Maybe it's time for me to change CD-driver software? Which driver do you use?

> A usual Audio player 'sees' only the first session of a cd. That's the
> reason why I use to add non-audio data (e.g., the cover) in a second
> session.

You can actually write data and audio in one burn instead of using multi-session, by making a mixed-mode CD - but only with the Pro-version as you mentioned, since the Audio version can't handle data tracks at all. The original way was to make the data track first and then add all audio tracks. Nowadays, there's another way to do it, which is called XA-mode if I'm not mistaken, where you put the audio first and add a data track last... I believe both those mixed-mode variations can be made with CDRecorder Pro, but I've never had the need to try it myself.
Many games-CD's are made with the original mixed-mode and that's why the first track is unreadable on them - but if you start by skipping to track 2 (regardless of how many data files there are in the data track, it's always just one track on a mixed-mode CD) directly after inserting the CD in the audio player, you can listen to the audio tracks anyway - at least on most new CD-players. The XA-mode (I believe it's also called "CD-extra") is probably better to use since all audio-players will see the audio tracks, but it's out of the original spec for mixed-mode CD's... Anyway - who cares as long as it works... ;)

Thanks, Dan, it does - in a way :) Is there a preferred response to
the choice? Is the "remote end" the target site/url or an intermediate
server? There is no information supplied by the choice-box on which to
make a conscious and intelligent choice of clicks :)

Further, re STiK2: the docs say disable all STinG parts. Does that
include SERIAL.CPX? Surely not?

Happy New Year,
Charles.

7710. USR 54K Message Modem command query

Hi all!

Does anybody know the AT command (or other command) used to activate "autonomous-mode" on the 56K Message modem?

The manuals are now supplied on CD-ROM as adobe acrobat files *groan* which my falcon doesn't like. I had a look at it on a friend's mac, but it doesn't list the commands to control the more esoteric features of the modem.

I'd like to put a small program in my magic STOP folder to spit this command at the modem as the computer shuts down. The only way I can do it at the moment is to manually start COMA and set the parameters from there.

Thanks in advance for any help!

OK, guys and dolls.

Before the year 2000 really ends I decided to try and get my feet wet on installing my old Atari rigs again. Nice to program them again and get this systems up-and-running.

Unfortunately, my favorite machine (1040STf, 3MB, 16 MHz!) does not want to boot anymore, but my MegaST2 does.

OK, so I have one system (MegaST2, STM144 , Megafile 30) up, an SH205 with 2 disks and an SM124 on stand-by ;-)

Next thing is that I really want this ST to be able to access the Internet, be it ftp, irc or whatever (maybe even Web-browsing!) THROUGH my Windows2000 machine, which has access to an ISP (still on dial-up but this will change to cable or maybe even satellite in due time of course).

This is what I have:
MegaST2, NO NETWORK CARD
PC with Win2K and Win98 installed, 1 free serial port.

I would like to share the Internet between my PC and my Atari OVER SERIAL LINE. In the ideal case, only the raw data is transported over this line. Second best is some kind of 'network' over which TCP/IP packets are send to and from Atari and PC. I guess I'll need some Atari stuff, some extra PC stuff (?) and a working configuration (ahem...this might be the hardest one, folks!).

If this would work, I could let my girlfriend go on the WWW with the PC, while I just use IRC or FTP (do not need much more ;-)on the Atari. Besides, I could finally start to try to do some software programming on the ST again maybe even to develop some nice Internet-capable thingies...that's what I bought PureC for in the first place back in 1990 or so...

So, any help is greatly appreciated. Happy newyear...
(PS: a copy in my e-mail box would be VERY nice, but is not necessary as I do actually try to keep up with this ng..).

7712. "Coldfire Atari"

Newsgroup: comp.sys.atari.st
Date: 2000-12-30 23:58:42 UTC
From: Dan <aahuls@xs4all.nl>
Message-ID: <978217200-246587AEicMi@xs4all.nl>
Source record: 52540

Hello,
In the German Atari mag "STC" of December 2000 there is an
interview with F.Aschwanden from Medusa Systems about the new
"Coldfire Atari". My STC mag has not arrived yet so I can't check
the following, but it seems that 200 definite preorders are
enough to start the building of the new machine. I will let you
know more when my STC is here.
Cheers and happy newyear (will be the case with a new "Atari" !)
Dan

7713. UK: Atari STE/FM/Monitor FS

Newsgroup: comp.sys.atari.st

UK: Atari STE/FM/Monitor FS

Atari 520 STFM with mouse (mouse/rf/drive checked ok) £24 plus P&P

Atari 520STE upgraded to 1 meg with mouse (mouse/rf/drive checked ok). Case damaged but not visible and TV modulator has been repaired in past but works fine £27 plus P&P

Atari SM125 Hi res monitor. Tested and seems okay - can't see any screen burn. The cable has been repaired and rejoined shoddily in the past - might be an idea to make a better job of it! £24 plus P&P

P&P £8 for each item (if required) - can be collected from Lincolnshire otherwise.

From: taj16@dreamscape.com
Message-ID: <t4stv1cddckbb0@corp.supernews.com>
Source record: 52447

Photochrome 4 does a superlative job of displaying GIF files on my Mega STE (as long as I remember to slow down to 8MHz). Is there a program somwhere that does an equivalent job with .JPG files? Or, failing that, is there a JPG->GIF converter? I've tried viewing JPGs with CAB 2.7, and it just doesn't measure up.

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

In one of our recent purchases from a local Atari development company, we discovered a box of Atari ROM/EPROM chips in amongst a box of Atari hardware. Some of them are in 'Atari Service' chip tubes with markings giving us some idea as to what they might be, while others are just secured in foam. We have no way of checking the chips, nor do I have any use for them, so I thought I would post them and see if anybody out there can put them to use.

I am listing them by the markings on the chips.

TT TOS 3.05 EPROMS (no date)
==========
4 Chips to the set: EE 9235, E0 B299, 00 1A7A, No Markings

IC Custom Rainbow TOS Set? (Atari 1987)
==========
Chip 1: C101629-001 / RP231024E / 0564 / 8810 Z12
Chip 2: C101630-001 /RP231024E / 0563 / 8809 Z10

Operating System ROMS? (Atari 1985)
==========
Chip 1: C026035 / 2322000 / M451018 8516G
Chip 2: AMI 8502MAC / C026034-01

Operating System ROMS? (Atari 1985)
==========
Chip 1: AMI 8530MAF / C026034-01
Chip 2: AMI 8530MAF / C026035-01

Rainbow TOS 1.4? (Atari 1985)
==========
Chip 1: AMI 8517MAA / C026034-01
Chip 2: AMI 8517MAA / C026035-01

If you are interested in any of these items, please respond to Jim at jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NO.SPAM. first). Or email me if you would like a current listing of other Atari ST/TT items I have.

Well, I've blagged it and I'm back. I'm not quite sure how, but it involved creating an INF file with just a 640*400*2 resolution in it so that REDIRECT would run to give me XBOOT and then copying my newly created INF file in at that stage to complete the boot-up. That's not the whole story, but at least I'm back and with access to 32k and 65k colours.

The disappointment is that I was unable to create any resolutions in 16M colours (24-bit) in VMG4000 and I've lost some of the largest resolutions in 65k. i used to be able to get up to 832*624*65k but now I can only get 720*544.

Hello,

I want to thank you all for your suggestions.

I learned one hard lesson. Never use contact cleaner or silicone
lubricant to clean the keys. (atleast from the top)

I went into the falcon again, took off all of the keys, sprayed it down
with contact cleaner hoping to get rid of the lubricant.

Put it back together, booted, this time not one single key worked!

Went in again, I took apart the entire circuit board screwed to
the keyboard assembly.

Underneath were these "rubber contact boots" (sorry, don't know
the formal name).

All of them were saturated with contact cleaner and lubricant.
Some of them were broken. The lubricant may have erroded some of
the rubber boots. I am not sure.

I got an old 1040Stf that I use for parts. Opened it up,
compared the circuit board to the falcons. Wasn't sure.
(This is before I read Claes's message)
Some of the IC chips had different numbers. I didn't want
to take the chance.
So I took out all of the intact "rubber boots" from the Stf and

put them in the falcon.
The circuit board underneath was also saturated with cleaners.
I carefully swabbed the whole thing down with q-tips and kleenex.
And let it dry in the sun.

Put it all together, booted, and guess what? It works!
The fluids must have been causing a short.

So I still have the falcon board and keys, but Stf action.
A little stiffer but thats alright. Most of the "old rubber boots"
were deteriorated anyway.

So thanks again for your help.

Have a Happy New Year!

ken

So, you're saying that you have the same mistaken display in
Serial.cpx too, but it doesn't make a difference to your connect
speed? Well, at least I'm not alone.

I take it RTS/CTS flow control is also ok?

I'll give it a try next time. I imagine it'll be ok for me.

> Why don't you shelve the 110 bit for a moment and just concentrate
> on getting the fastest possible 'normal' speed and work up from
> there.

38k4 is the fastest spee, unless you know of any modem that supports
76k8 or 153k6. Either that or I bite the bullet and go for Serial 2
(which would also be long overdue...)

Aren't you the clever one?
You're destroying the bits and pieces that's left of the Atari market, since you make all the commercial software available for free. No retailers can continue to sell anything, which in turn makes people without access to the Net change platform due to lack of software. Instead of making things easier for the Atari community, you destroy whatever is left because you want to look like a good samaritan who spreads all available software to everyone. Such behaviour has speeded up the professional developers' leaving of the Atari platform - and who's to say that the very competent shareware programmers won't leave because their work constantly gets spread together with cracks etc - in spite of their very reasonable registering fees...?
The platform we all love deserves that we make an effort to hold back piracy, because otherwise all the development will stop earlier than necessary :-(When the market is as small as the Atari market is now, all piracy does quite a lot of harm to the platform, so start paying for the software you use or don't use it! We need new stuff too, and not only programs that are a couple of years old, and that won't happen if everything gets pirated as soon as it comes out.....

TJ,
Try an Apex Viewer (TTP) as an external program in CAB (FLC,GIF,JPG,TGA).
When set up, they kick in for the file extension selected and after
viewing then returns to CAB. I don't have the URL they came from so if
you can't get them then E-mail me. Also, as far as converting JPEGs to
GIFs (non-animated) I like IMAGE COPY for viewing and converting from a
number of formats to another.

Goood points. However does this mean getting permission from the original programmers and companies to have ex-commercial Atari software as Freeware in the same catagory as what you say? It has taken me YEARS to get some of the programs that are now available on my site, so that they would not be lost to Software Oblivion. (I am speaking of Atari-Midi stuff) However, we DO want new software. And THERE IS new software being developed. (Take ACE....a Falcon Soft-synth now in development...see the Jan. 2001 edition of SOS magizine: Atari-Notes)

I suppose there is a differance between getting PERMISSION for release and flat out No-barrs downloads)However..this has come up before...are these emulator sites actually "preserving" the Atari Platform by making available programs that otherwise would go to Oblivion? It is a Question of Ethics.

7730. Re: CD-R/CD-RW questions

Newsgroup: comp.sys.atari.st
Date: 2000-12-31 11:57:00 UTC
From: Peter_Schneider@su2.maus.de
Message-ID: <200012311257.a52783@su2.maus.de>
Source record: 52487

Hi Claes,

CH>I've made DOS-compatible have been recognised completely on my PC, but
CH>not on my Falcon where I've had to change session with the CPX I
CH>mentioned. The same goes for Atari-format multi-session CD's (with the
CH>difference that they can't be read correctly on the PC, naturally...).
the only difference between `Atari'- and `PC-'CDs is the letters being
used in file and folder names, I think. E.g. the german umlauts give
little problems on a PC-burnt Atari CD when looking at it on an Atari.

To avoid problems you should restrict to the ISO 9660 conditions (no
umlauts, no extensions for folders, 8 directory levels only)!

CH>Maybe it's time for me to change CD-driver software? Which driver do
CH>you use?
Here, it's SPIN working together with HDDRIVER. And I repeat myself:
Usually I can't see if a CD has more than one session. The only
occasion to do so is either the CPX you mentioned or adding a session
to a previosly burnt unfinished CDR.

CH>You can actually write data and audio in one burn instead of using
CH>multi-session, by making a mixed-mode CD - but only with the Pro-
CH>version as you mentioned, since the Audio version can't handle data
CH>tracks at all.
Right. But following the terminology of SoundPool, such a CD is called
CD-Extra.

And
CH>The original way was to make the data track first and then add all
CH>audio tracks.
is called 'mixed mode' CD. That has the disadvantage that the numbers
of the copy differ from the original. And even worse, not all audio
players are able to ignore that data track which might result in
damage to your speakers.

CH>Nowadays, there's another way to do it, which is called XA-mode if I'm
CH>not mistaken, where you put the audio first and add a data track last.
Right, so do I. And as the data track always belongs to the 2nd
session, it can't be found by any audio player.

CH>I believe both those mixed-mode variations can be made with CDRecorder
CH>Pro, but I've never had the need to try it myself.
Yes, that's true however I never burnt a mixed mode CD until now.

CH>Anyway - who cares as long as it works... ;)
That's it. A happy New Year to you and all reading this!

Actually we're not having any luck running on Atari's anymore.
It had a strange date bug on January 10, 2000. That's right, the 10th,
not the first. Since the keeper of the source code has disappeared, this
glitch was never resolved and the unfortunately FNET network wilted away
to nothingness.

7738. Bitbopper download problem

Newsgroup: comp.sys.atari.st
Date: 2000-12-31 15:01:57 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <92nhp5$4at$1@plutonium.compulink.co.uk>
Source record: 52467

Hi!

Following an announcement in AONE online magazine that the BITBOPPER sound-to-light software for the Falcon had now been released free (but without support) and was available for download from:
http://www.owonder.com/bitbopper/falcon/download
I spent about 15 minutes downloading the 2.2 MB ZIP file as well as the HTML instruction manual.

All seemed to go well. The manual when extracted was readable in CAB (although the illos were missing) and the program ZIP file seemed to extract OK and produced a normal-looking file/folder structure. However, when I tried to run the program. although it seemed to run and appared in APPLINE but not in MagiC's file list, no menus or anything appeared on the screen.

I extracted it again with UNZIP.TTP (5.13) in case ZIPJR.TTP in 2-in-1 had made errors, but the results were identical. I did notice that after having tried to run this second copy and not kicked it out, when I tried to delete the package it deleted all files but MENUS, to which access was denied with (TOS -36) - presumably because it was locked (by MagiC?) as being used by the program. After kicking out the PRG the file deleted OK.

I then took a closer look at the contents of the files with Look'n See. The PRG seemed OK - had the usual strings in it - but none of the other files were. Thus what were supposed to be ASSIGN.SYS and EXTEND.SYS files were binaries, not ASCII. The three illos - a GIF and 2 TGAs - refused to show in any graphics program I have and didn't seem to have the right headers when looked at as a binary. The MENUS file was all binary where I would have expected a good bit of ASCII and had '2.TGA' and 'TPIC8BIM' near the beginning.

The next bit made me suspicious, at it appeared to include commercial software: There was what purported to be SPDGDOS.PRG in an AUTO folder but that reported 'File not executable, Error #-66' when trying to run it and a binary examination showed no word strings in it - one would have expected at least an alert. Similarly in the fonts folder were supposedly three Speedo fonts, and while these were roughly the correct size they were definitely not fonts: They had strings in them like 'update.datt', 'TEXTttext', 'PICT 1,32,1' and 'MSMOVIE' and the 11 TDF files(!) accompanying three SPD files were also binaries instead of the descriptive metrics that they should have been.

I don't know the structure of the remaining files in the archive so can't tell if these were messed up as well.

The point of this long missive is: Did anyone managed to download this archive and then get it to run? If so, whart could have caused the apparent mix up/corruption of the files, when ZIP did not report any errors, even when run in 'Test' mode? (BTW the files were deflated with ZIP 2.0 on a Macintosh).

OR IS THE WHOLE THING A HOAX?

Regards, /Peter/

Hi All,

no-one's mentioned Graftool, it doesn't convert JPG to GIF but has a
superb set of filters, the enhance focus and/or sharpness are the
best out and the scrolling is very smooth and also has a catalogue
feature. As to CAB 2.7/2.8, it may be a bit slow, but it has the ability
to display many more variations of JPG than any of the other programs
mentioned.

Bob King.

Have you managed to get this to work? I just posted a long message in comp.sys.atari about downloading this file direct from the makers bitbop@owonder.com, but found that (apart possibly from the program file) the files weren't what they were supposed to be (and also appeared to include commercial software, namely SpeedoGDOS and fonts).

I have sent a mail to the source, but in the meantime - did anyone get Bitbopper to work?

Happy New Year to all!

>Put it back together, booted, this time not one single key worked!

I am not surprised! The silicone lubricant is almost certainly an
insulator, and the Atari keyboard uses open cpontact pads that are
bridged by a carbon knob in the centre of the elastic cup.

>All of them were saturated with contact cleaner and lubricant.
>Some of them were broken. The lubricant may have erroded some of
>the rubber boots. I am not sure.

Possible, though they do wear in time anyway.

>So I took out all of the intact "rubber boots" from the Stf and
>put them in the falcon.

You can also buy replacement that improve the 'feel' of the keyboard
from Atari Workshop in the UK or Best Electronics in the USA.

More likely a non-contact, I would have guessed.

Glad you got it sorted.

Happy New Year!

Regards, /Peter/

GET is the general safe response. That's why I made the new
config file setting. This will work with a majority of these situations.

>server? There is no information supplied by the choice-box on which to
>make a conscious and intelligent choice of clicks :)
>

With GET it's not problem. There are a few situations where this
occurs naturally.

1. The site wants you to have a cookie so they pop you around and feed
you a cookie in the process based on the information they just sent you.

2. You new destination is changed since you have given them certain
information. Many of the search engines have their databases split
accross different servers, a search query will many times isolate all your
future transactions to one or two servers.

I'm sure there are a few others but this is the main general usage.

Now there is a potential illegal transaction that can occur in these
situations as well, but in general only affect you n the situation of a
rePOST of the data. Say you are purcahsing something from an online store
and have information you may not want others to have included in the data.
It has been done before and can be done with a few tricks. To feed you a
redirection falsely that might encourage you to repost the private data to
a new source. This is a tricky thing to do and doesn't occur very often
any more that I have heard of, however it is a potential consideration in
the reposting of the data.

As to no feedback about the new site, that isn't limited to the
atari or CAB. I would try to get something better in there to inform the
user about the new location, but it would take a fair amount of work and
might not be all that helpful (or stable) in the long run. You see you
don't necessarily know where your data is supposed to be sent, or for that
matter what the IP address is for the new location. So if you were to be
supplied with an IP address asking if you wanted to repost the data there
would it be helpful? We could make it trace addressses and return the
result in the infomration. However this makes a system that is not
entirlely very fast and depending upon the site and your DNS may still not

provide you with realistic information.

So in the end it is soemthing to be consciencous of no matter what platform you are on, but your ability to do much about it is limited. Try GET, as I said before that is the default and should not be sending anything too confidential to the new site.

>Further, re STiK2: the docs say disable all STinG parts. Does that
>include SERIAL.CPX? Surely not?
>

Actually that is one of the worst offenders. With HSMODEM installed STIK2 uses the real dte rates. WIth serial.cpx installed you have to mess around with the remapped rates. All that 150 stuff. It also has been reported to reduce speed and stability. Don't ask me what it's doing that causes this. But compatibility problems with this CPX have been reported for years. I don't use it so have never been to concerned personally about figuring it out.

Goodbye to the 20th Century, it's been an interesting 100 years. From the Wright Brother's first powered flight, to the International Space Station of today. From the millions of people killed in wars, including the First and Second World Wars to more recent killing fields of the Balkans. From the discovery of antibiotics to the decoding of the human genome.

Goodbye and good riddance to much of it. Let's hope the coming century will be more peaceful and cleaner, sometime soon oil will run out, and hopefully the world will become less polluted. Hopefully mankind will realise that our time on this Earth could be short indeed and if we wish to survive as a species we should start working towards colonising the solar system.

Now this is interesting. So far I always have used serial.cpx a I
thought it was necessary. Indeed STik 2 runs happy without the cpx. I
can't say much about the speed as right now with all the people
celebrating 2001 the Net is very fast. I wished it was always so fast.
